WE BUILD THE STRONGEST WIND MILL in the WORLD. (13 SIZES.)

For farm pumping, irrigation, drainage, grinding, and all power purposes, from 1 to 30 horse-power. Circulars free.

ECLIPSE WIND MILL CO., Beloit, Wis.

HALLADAY STANDARD.

The only wind-mill awarded
TWO MEDALS and
TWO DIPLOMAS
by the **CENTENNIAL JUDGES.**

Every machine warranted to be well made of good material; to do good work in any kind of wind; to be perfectly self-regulating; to possess more power, and to be more reliable than any other wind-mill made. Each piece is fitted and numbered, so that a stranger can put the mill up, using our drawings and printed instructions for a guide.

Send for **CATALOGUE "A"** and Price List.

U. S. WIND ENGINE & PUMP CO.,
BATAVIA, ILL.

The Old Reliable Banner Wind Mill.

The most substantial, efficient, and economical wind engine made. Has latest improvements. Circulars free.
N. P. MIX, Inventor and Manufacturer,
Avenue, Franklin Co., Ohio.

W. S. BLUNT'S UNIVERSAL FORCE PUMPS.

Secured by letters patent.

These pumps have enormous power, and are for the house or for out-door wells of any depth. They are constructed with special regard to strength, ease of working, and durability. They can be immediately changed from lift to force pumps, and the air chamber can be revolved, so as to allow the handle to work at any desired angle with the spout. Having close tops, they cannot be tampered with. Attention is called to our new elegant pattern **DEEP WELL non-freezing FIRE PUMP.** Also, Blunt's Sand Vacuum Chambers. A complete protection against sand or gritty water in dug or driven wells, pits, mines, and rivers. For hand or steam pumps, all sizes, from 1 1/4-inch to 4-inch suction pipe.

Send for circulars to
NASON MFG CO.,
71 Fulton and 71 Beekman St., New York.
Western Agency, Chas. W. Newton,
150 Lake St., Chicago.
Pacific Coast Agency, Dunham, Carigan & Co., San Francisco, Cal.

All with trademark.

New Cut-off. Enlarged

Reservoir. New Decorations. Illustrated Price-list.

Farnham Improved Woven Wire Bed

The most beautiful, durable, and elastic spring ever invented, needing but a blanket or light mattress to make them luxuriant. Especially adapted to warm climates. Hotels, Steamers, and Hospitals, will find them just what they need. Vermin will not live in them. Woven of fine wire, it adjusts itself to every part of the body, being a perfect support. For the testimony of one who has thoroughly tested them, see Oct. No. 1877, of this paper. We manufacture all kinds of Woven Wire Beds for Hospitals to order. J. W. Mason & Co., 375 Pearl St., N. Y., are my wholesale agents. Price of full size, delivered, \$12. Liberal discount to the trade.

HIRAM BUCKINGHAM,
Chester, Conn., Sole Manufacturer.

The latest, most simple, and important Patent invention ever made is the

"HAND MOTOR" FOR Sewing Machines.

Work can be done as fast by hand as by foot, enabling weak females to sew with ease and comfort. This "LIFE PRESERVER" can be attached to most all Sewing Machines at small expense. It works equally well by foot as by hand. Several persons have expressed willingness to have these in their dwelling houses, when they would not suffer the FOOT MOTOR to be there. Here is a good opportunity to make money by purchasing at wholesale and to retail to families. For sale by

JAMES BANCROFT, Manager.
ATHENS, GEORGIA.

2d EDITION JUST ISSUED.

The Sportsman's Library of STANDARD BOOKS,

Containing Brief Descriptions of nearly

Two Hundred and Fifty BOOKS upon

Out-door Sports and Amusements,

and Illustrated with a great

Number of Spirited Engravings

of Game Birds, Fish,

Horses, etc., many of

them Drawn from Life.

Should be in the hands of every sportsman; every one wishing to acquire the art of shooting, or to obtain information regarding Game Birds, Fish, Horses, Guns, and Equipments. —Hon. N. P. Stanton, President National Rifle Association.

A handsome compilation, the demand for which is gratifying evidence of an increase of interest in manly pastimes. —Col. Wm. C. Church, Editor Army and Navy Journal.

A complete compendium. Contains all the best and reliable books on these interesting topics, also characteristics of birds, fishes, dogs, etc. Natural history also finds its place. —Forest and Stream.

A welcome and much needed publication, telling where to find good text books upon this or that sport.—Geo. S. Schermerhorn, Jr., Secretary National Rifle Association.

FOOD FROM THE FAR WEST;

OR

AMERICAN AGRICULTURE,

With Special Reference to the Beef Production and Importation of Dead Meat from America to Great Britain,

By JAMES MACDONALD,

Author of "The Highland Society's Prize Essays on Agriculture," etc.

This is an interesting Volume of about three hundred and fifty pages, presenting the observations and experiences of an educated Englishman, who spent a long time among the prairie farms and sheep and cattle ranches of our Western States and Territories.

Those who contemplate going West, either to see the country or to settle, and those who desire information regarding Sheep and Cattle raising will find this a specially valuable volume.

12mo. PRICE, POST-PAID, \$1.50.

This book will be sent to the trade at our usual terms.

ORANGE JUDD COMPANY, 245 Broadway, New York.

(CAMPAIGN OF 1879.)

NEW CHAMPION REAPER.

Operated by the same **marvelous movement** which has made the **NEW CHAMPION MOWER** such a wonderful success.

The remarkable feature of these machines is the **NEW MECHANICAL MOVEMENT** for driving the knife. It possesses **more** strength and durability than any of the best systems of gearing heretofore in use for this purpose, and **does away** with **nearly all the noise and friction** common thereto; the **direct results** being **extreme lightness of draft**, and **greatly increased cutting power**.

Reapers and Mowers will be on exhibition this fall at many of the County, District and State Fairs throughout the United States and British Provinces.

From every Fair and Agricultural Exhibition at which it was presented last season, the New Champion bore away, with only two exceptions, the First Honors—The Red Ribbons.

Do not purchase a Reaper or Mower until you have examined the NEW CHAMPION at your Fair this fall.

Manufactured by Whiteley, Fassler & Kelley, The Champion Machine Company, and Warder, Mitchell & Co., Springfield, O.; and The Toronto Reaper and Mower Company, Toronto, Canada.

Stockbridge Manures

Originated by Prof. Stockbridge, Professor of Agriculture in the Mass. Agricultural College.

Wheat Manure (200 to 600 lbs. p. acre), p. ton **\$45.**

This famous Stockbridge manure has produced from 25 to 40 bushels Wheat per acre, depending on soil, season, &c. It is too strong to be sown in the drill with the seed, unless it is extended with three times as much dirt or plaster. The better way is to sow it broadcast just after the land is plowed, and work it into the soil with the harrow.

For Rye (200 to 400 lbs. per acre), per ton **\$45.**

This has produced from 20 to 35 bushels Rye, and has given excellent satisfaction. Apply in the same manner as for Wheat. Two Rye fields, 5½ acres in all, yielded two tons Straw and 32½ bushels of Grain per acre. Sturtevant Bros., Mass.

Also for sale Agricultural Chemicals, Animal Meal for Fowls and Swine, and a full line of Poultry Feed. Send for Pamphlets, &c., free. A live responsible Agent wanted in every County in the Middle States.

W. H. BOWKER & CO., 3 Park Place, New York, 43 Chatham St., Boston.

House Plans for Everybody.

By S. B. REED, Architect.

PROFUSELY ILLUSTRATED.

12mo.

PRICE, POST-PAID, \$1.50.

This is a valuable work which meets the wants of persons of moderate means, and we predict that it will prove one of the most popular architectural books ever issued. It gives a wide range of design from a dwelling costing \$250 up to \$8,000, and adapted to farm, village, and town residences. Nearly all of these plans have been tested by practical workings. They provide for heating, ventilation, etc., and give a large share of what are called Modern Improvements.

One feature of the work gives it a value over any similar publications of the kind that we have seen. It gives an estimate of the quantity of every article used in the construction, and the cost of each material at the time the building was erected, or the design made. Even if prices vary from time to time, one can, from these data, ascertain within a few dollars, the probable cost of constructing any one of the buildings here presented.

NEW-YORK.

W. S. BLUNT'S UNIVERSAL FORCE PUMPS.

Secured by letters patent.
These pumps have enormous power, and are for the house or for out-door wells of any depth. They are constructed with special regard to strength, ease of working, and durability. They can be immediately changed from lift to force pumps, and the air chamber can be revolved, so as to allow the handle to work at any desired angle with the spout. Having close tops, they cannot be tampered with. Attention is called to our new elegant pattern **DEEP WELL non-freezing FINE PUMP.** Also, **Blunt's Sand Vacuum Chambers.**—A complete protection against sand or gritty water in dug or driven wells, pits, mines, and rivers. For hand or steam pumps, all sizes, from 1½-inch to 4-inch suction pipe.

Eight Subscribers one year,	\$9, or \$1.12 each.	\$1.30

Ten or more Subscribers, post-free, Only \$1 each.....

[* These 15 month's terms are added to accommodate those who may wish to begin with the October number, and continue through 1879, a period of fifteen months.]

Single Numbers sent, postpaid, for 15 cents each. Specimen numbers for examination sent, postpaid, for 10 cents each. Subscriptions can begin at any time.

The above terms are for the United States and Territories, and British America. Add 14 cents extra per year for papers delivered by mail in N. Y. City, and for copies sent outside of the United States and British America, except to Africa, Brazil, British Honduras, the East Indies, and Mexico. For the last named five countries the extra charge is 38 cents per year, to cover extra postage; Single Numbers, 17 cents, post-paid. Remittances, payable to Order of Orange Judd Company, may be sent in form of Checks or Drafts on N. Y. City Banks or Bankers; or P. O. Money Orders; or in Registered Letters, such letters to have the money enclosed in the presence of the Postmaster, and his receipt taken for it, and the postage and registering to be put on in stamps. Money remitted in any one of the above three methods is safe against loss. Bound Volumes from Vol. 16 to 36 inclusive, supplied at \$2 each, or \$2.30 if to be sent by mail. Sets of numbers sent to the office will be bound in our regular style for 75 cents (30 cents extra if to be returned by mail). Missing numbers in such volumes supplied at 10 cents each. Any Numbers of the paper issued for 21 years past, sent post paid for 15 cents each;

or any full year, sent unbound, for \$1.50.... Clubs of Subscribers can be increased at any time, at the club rates, if new members begin at same date as the original club.

Good Things Coming For All.

Useful, Most Desirable Articles,

TO BE HAD

WITHOUT MONEY,

AND

More Easily than Ever Before.

- First-rate (best) Sewing Machines
- Table Cutlery—Pocket Knives
- Spring Beds—Water-Throwers
- Tool-Holders—Guns—Pistols—
- Mens and Boys Pure Gum Boots—
- Seed-Drills—Seed-Sowers—Pianos,
- Household Articles—Family Games
- Amusing Things for Children—
- Organs—Tool Chests—Gold Pens
- Pocket Pencils—Writing Desks
- Work-Boxes—Boys' Wagons
- Bracket Saws—Embroidery
- Frames—Good Books—etc., etc.

Notwithstanding the Reduction in subscription prices, the Publishers intend to continue their long-established custom of sending Valuable Articles as acknowledgments, or Premiums to their friends who take the trouble to gather and forward lists of new and old subscribers to the *American Agriculturist*, and most of the articles are offered for a less number of subscribers than ever before, even at the reduced terms. It will therefore be easy for any one, anywhere, to secure one or several of these articles free, in return for very little time and trouble.

A few of these articles are described on page 398. A large, Illustrated Full Descriptive List of the Premiums offered will be ready on October 1st, or soon after, a free copy of which will be mailed to any and every one desiring it, who will send his or her full address on a Postal, and say, "Premium List Desired."

An Open Secret.

HOW CAN VALUABLE PREMIUMS BE GIVEN, WITH THE PRESENT REDUCED SUBSCRIPTION RATES?

Answer:—Our Readers are only asked to pay for the actual cost of making and mailing the paper to them—not all of that even. Good advertisements (only) are inserted for the three-fold purpose, of furnishing reliable business information to the readers, of supplying the deficiency in the cost of the paper not met by subscriptions, and for a reasonable business income to the proprietors.

Increased Circulation brings more advertising receipts. So the Publishers pay, out of the advertising receipts, premiums to those who assist in keeping up and increasing the number of subscribers.—More circulation also brings more readers to be benefited by the paper, and that, of course, is gratifying to the Editors.

Instead of Cash premiums, the Publishers arrange to supply good, useful, desirable articles, which they buy in large quantities, at the lowest wholesale cash rates, and pay for in part by advertising. In this way they can give much larger premiums than they could in cash, while the articles are just as valuable as money to those receiving them, even more so, as they are sure of being reliable.

It is a good thing all around: The Premium receivers get good articles, free; the new subscribers brought in are set to reading and thinking, which pays them; the manufacturers of good articles have them brought prominently before the public; the circulation of the paper is increased, and advertisers reach a wider field, and pay more; the Publishers thus have more receipts, and can make a better paper, and every reader gets the benefit.—There is abundant room for every one who wishes, to secure one or more of the premiums. Though almost every copy of the *American Agriculturist* is read by a good many persons, probably its total number of readers does not exceed two millions; so there are forty-two millions more in this country who ought to read it. Any one can find near him a few, if not many, persons who may be gathered in a premium club.

The Good Watch

Still Available.

Since offering this watch, as described on page 354 of the September *American Agriculturist*, the Publishers have purchased all the watches of this form and kind they could obtain in this country, and have ordered more from the Manufactory in Switzerland. Each one is started and run a few days before sending out, and regulated to within a few seconds of variation per day at ordinary temperature. Of course it is understood by all, that any watch will run a little slower in hot weather, and a little faster in cold weather, unless it be provided with a "compensating balance," which is only used in very costly time-keepers. All these watches that we have yet tried, when regulated, run to within a few seconds per day in the usual temperature. Indeed a good many of them, after a week's regulating, have run to within two to three seconds a day. *It is the best watch for the price we have ever seen*—better than we ever expected to find at so low a rate.

A large number of requests are daily coming in from those who wish the offer extended, so that they may have more time to raise the requisite club of subscribers. In response to their requests, and as we have the promise of an additional supply at an early day, we shall continue the offer for the present, or until further notice, upon the same terms as stated last month. For particulars, see page 354 of our last paper (September number).

These watches are designed for a special premium, but so long as a full supply can be obtained for this purpose, single watches will be sold to our readers who desire them, at \$10 each, as announced last month.

Every German Cultivator and Laborer on the Farm, or in the Garden, OUGHT to have the German *American Agriculturist*, and thousands of new subscribers are taking it this year. It contains not only the Engravings and all the essential reading matter of the American edition, but an additional *Special German Department*, edited by the Hon. Frederick Münch, of Missouri, a skillful, successful cultivator and excellent writer. No other German Agricultural or Horticultural Journal in America has been so long issued, or contains so much useful information and so many engravings.

Reliable Business Men, those who have both the ability and the intention to do what they promise, are the only ones invited to use the business-pages of this journal, and those in charge of that department are under positive instructions to admit no others at any price; and they try to live up to it, and generally

do, though once in a while they may make a mistake—to err is human—but this seldom occurs. We could make a fortune in a single year, and supply the paper at lower rates, if the advertising pages were thrown open to those who gladly pay high prices, as they can afford to, because they give little for much. But we mean our advertising pages shall be a valuable source of trustworthy information to our readers.—When ordering from, or corresponding with any of our advertisers, or sending for catalogues, etc., it is well to state that you are a reader of this Journal. They will know what we expect, and what you expect of them as to prompt and fair treatment.

Failure of a Commission House.—The firm of Hull & Scotney, commission merchants of Philadelphia, have failed. The remaining partner, Mr. Scotney, writes that he was taken ill at the time, and for that reason did not notify us, hence the advertisement appeared in the usual place in our columns, a month after the firm had ceased to exist.

The Asbestos Liquid Paints of the H. W. Johns Mfg. Co., have had remarkable success. They commenced making the paints a comparatively short time ago, and are already the most extensive manufacturers of paints in the country. The Company, No. 87 Maiden Lane, N. Y., offer special inducements to those who wish to introduce these paints in places where they have no local salesmen, and suggest that those seeking employment, or wish to add to their income, correspond with them with a view to business.

"Ashton's Factory Filled Salt" Premiums at the Dairy Exhibition.—Messrs. Nicholas Ashton & Sons, Liverpool, Eng., have written to their agents, Francis D. Moulton & Co., as follows: "We notice, with great interest, the movement for an International Dairy Fair, to be held in New York during the coming autumn, and trust it may meet with the success which the importance of the industry it will represent should command. We authorize you to offer to the Executive Committee five hundred dollars in gold for premiums, to be awarded to those who exhibit the best butter and cheese salted with Ashton's Factory Filled Salt. We leave to your judgment the conditions under which the awards shall be made." In accordance with the above, the following premiums are offered by Francis D. Moulton & Co.: "1st. For the best lot of cheese made with Ashton's Factory Filled Salt, whether from Canada, New York, New Jersey, or the New England States, \$125. 2d. For the same from Pennsylvania, Ohio, Michigan, Wisconsin, Indiana, Illinois, Iowa, Kansas, Nebraska, or Minnesota, \$125. 3d. For the best butter made with Ashton's Factory Filled Salt, whether from Canada, New York, New Jersey, or the New England States, \$125. 4th. For the same from Pennsylvania, Ohio, Wisconsin, Indiana, Illinois, Iowa, Kansas, Nebraska, Michigan, or Minnesota, \$125."—We trust that the competitors for these very liberal premiums will be numerous, and add greatly to the interest in and success of the exhibition.—N.B.—As will be seen by the advertisement, this salt is now put up in bags of 56 lbs. each, for the convenience of families and small dairies, who do not care to purchase the large bags.

The "Forest Rose" Strawberry.—As this promises to hold an important place in strawberry culture, it is desirable that its history be accurately recorded. In describing this variety in Ang. last, Mr. Roe states that it was discovered by Mr. J. A. Fettes, of Lancaster, O., who sold out his right in it to Mr. Weltz. Mr. Fettes writes that this is not exactly correct; he has not sold his interest in it, but has made arrangements with Mr. Weltz to sell the "Forest Rose" strawberry for a limited time.

HAVE YOU A HOUSE To Build, to Plan, to Alter, to Repair?—If so it will pay to first get and read Reed's "*House-Plans for Everybody*," just issued. It is full of plain practical suggestions all about houses. It gives engraved plans of 36 different houses, ranging in cost all the way from \$250 to \$8,000 each, illustrated by 175 engravings; describes the materials required, the items of cost, etc., etc. If one is to spend only \$25 to \$50 in repairs or changes, this book will save much more than its cost. Considering its size, its engravings, its real value, it is probably the cheapest book on house-building ever issued. The price, sent anywhere in the United States, post-paid, is only \$1.50. Published by Orange Judd Company.

Sending Goods to New Zealand, Australia, etc.—New Zealand has a very large number of readers of the *American Agriculturist*, many of whom often write to us for information, which of course we are always glad to supply when practicable. Some queries are just at hand as to the shipping of goods there from America, particularly referring to advertisers in this Journal. There is a line of vessels running be-

tween New York and Anstralia, New Zealand, and the East, called the "Pioneer Line." The freight tariff varies with the season, and ranges from 27½ cents to 30 cents per cubic foot. In ordering goods of any of our advertisers, money in amount equal to the mentioned prices only need be forwarded, and the freight can be paid on receipt of goods. When convenient, it is well for neighbors to club together, and send their combined orders to some trustworthy person here, who will see that all are properly filled. Any thing that we can do in the way of purchasing and forwarding desired articles, we will very cheerfully attend to.—Messrs. R. W. Cameron & Co., of this city, make it their business to effect purchases in all parts of the United States, and will send them to any part of Anstralia, New Zealand, and the East, in consideration of a commission of 2½ per cent. Their agents in Dunedin and Christ Church are Messrs. Dalgety, Nichols & Co.; in Melbourne, Stuart, Couche & Co., and in Sydney, R. Towns & Co.

Living Plants in the House are always desirable on many accounts. They give pleasure, and cultivate a taste for the beautiful—in children even. The best information ever given to enable the inexperienced to grow plants successfully, is supplied in a valuable book just issued, entitled "*Window Gardening*," in which the author talks from successful experience and practice. The cost of the book is only \$1, including postage, to any part of the United States. Orange Judd Company, Publishers.

All About Manures, and Manuring.—This topic, so important now to every farmer, is treated very fully in a Book just issued. It is the result of many years' experience and observation by an educated practical farmer, the author of "*Walks and Talks Upon the Farm*," etc. Every cultivator would find it worth many times its cost. The information is given in plain conversational language, adapting it to the comprehension of all classes. Price only \$1.50, postage included. Sent by Orange Judd Company on receipt of price.

Fine Gladioluses.—On July 15-17th, Messrs. C. L. Allen & Co., of Quecus, N. Y., made, at the auction rooms of Messrs. Young & Elliott, No. 12 Cortlandt St., an exhibition of Gladioluses, which was large and fine. The display has never been equalled in this country, and it is doubtful if it could be excelled abroad. Besides the standard sorts, there are thousands of seedlings, some of which are of great merit, and the result of years of careful labor in this specialty.

Embellish the Stable.—Coachmen, hostlers, and other stablemen, take pride in the appearance of their animals and their surroundings. We often see stables embellished by pictures of famous horses, and if nothing else is at hand, advertisements of stallions, announcements of races, etc., are put up in conspicuous places, that might well be occupied in a more useful manner. Doct. Liataud has just prepared, and the Orange Judd Co. has published, a chart which may well have a place in any stable, large or small, as while it gratifies the common desire to decorate, it can not fail to prove useful. The chart gives, by the aid of abundant engravings, and brief, though sufficient descriptions, the method of telling the ages of domestic animals; especial prominence is given to the horse, but cattle, sheep, pigs, and dogs, are illustrated also. The appearance of the different teeth at the various periods of the animal's life, is distinctly given in the engravings, while the descriptive matter is arranged in a table that admits of ready reference. This chart gives the information that might be spread over the pages of a considerable volume, and has the advantage over that in presenting the whole subject to the eye at once. A great deal may be done in the way of teaching, without assuming to teach, and many, with this chart constantly before them, will become familiar with its contents without knowing it, while the same presented in a book form would be disregarded. The chart is 24½ by 21½ inches, on heavy card-board, and may be framed or not, as one fancies. Sent by mail, post-paid, for one dollar.

"Birds of all kinds, and their plumage, are much used for house decoration," is given in the "*Home News*," of a daily paper, and very unpleasant "news" it is. We were rejoicing that the custom of killing every thing guilty of no other crime than that of wearing feathers, for the decoration of bonnets, or hats, was abating, and here "bird murder" appears in a much worse form—"House Decorations" indeed! Women—Ladies (if you please), can do much to control this kind of decoration—or desecration. We appeal to them not to countenance the killing of God's most beautiful creatures, that their skins may be degraded to the uses of wall paper. If we tolerate this, do we not deserve a greater plague of insects than we have yet suffered? Let every woman resolve to tolerate no ornament on her person, or in her house, that will encourage bird killing.

American AGRICULTURIST.

NEW YORK, OCTOBER, 1878.

The Guernsey Cattle.

The Guernsey breed of cattle is now receiving considerable notice from our breeders. In this country the Jerseys have heretofore monopolized most of the attention bestowed upon Channel Island cattle, though the number of Guernseys exported is large. The average yearly number of cattle sent from the island of Jersey is about 2,000, and from Guernsey half that number. Of the many thousands thus exported, comparatively few have

of the Guernsey cows that we have seen, are nearer the ideal cow than any others we have met; their rich color, large, fine bodies, handsome proportions, fully developed udders, and other "milk signs," together with their docility, and their rich and generous milk and butter yield, make them a distinct and characteristic breed of dairy cattle. The Jerseys hold a justly deserved prominence as butter producers, and it is safe to predict that their numbers will greatly increase. The recent numerous sales indicate an increase in the importations, notwithstanding the fact that some of our breeders are now breeding just as good Jerseys as can be found anywhere in the world. The rapid depletion of the herds of the "mother country" under the annual culling out of 2,000 animals for exportation, renders this state of affairs inevitable. It is a fact, that the best Jersey cows, both on the Island and in this country, closely resemble the Guernseys in

ton. Careful experiments place well cured corn-stalks as worth about three-fifths as much as hay.

Fodder Stacks.—Much has been previously said in the *American Agriculturist*, as to the methods of curing corn-fodder. A caution may yet be given. *Let the stalks be thoroughly cured before being stacked.* Small stacks will not readily heat and mould; large ones will. Put a ventilator, if only three or four rails set on end, spread below, and tied at top, in the middle of the stack. Carefully build, or protect them on top, so as to shed water. Better finish the

Husking, if possible, while it is still pleasant weather. It is disagreeable work on a raw November day, when fingers get numb, and the body chills quickly. Last year we saw farmers with wives and children thus employed, when snow was on the ground and all through the stooks. And so it will be again with others who are behind hand.

FIRST PREMIUM GUERNSEY COW, "LADY JANE," AND GUERNSEY HEIFER.

come to this country. The engraving represents a scene in a pasture on the farm of Mr. Rendle, at Catel, Island of Guernsey, with a view of the farm buildings in the distance. The cow in the foreground, owned by the gentleman above named, is "Lady Jane," a first prize winner at the fairs for many years, and an excellent specimen of the breed.

The Guernseys are similiar in build to the Jerseys, though larger and inclined to flesh, and not so stylish. Their color is usually a rich fawn, with much white; the muzzles and eyelids are buff; in fact, all the "points" are light, offering a strong contrast to the black points of a fashionably marked Jersey. The Guernsey is a deep milker, producing the yellowest of butter of superior quality. Some good judges, familiar with both breeds, place the Guernseys ahead of the Jerseys as butter makers; while their size and capability of taking on fat when they cease to be useful for the dairy, render them a desirable breed. One farmer of our acquaintance, who has an excellent herd of both of these breeds, says the admixture of the cream from Guernsey milk with that from Jerseys gives the butter a deeper, richer color, and makes it bring a higher price than that from the Jerseys alone. The Guernseys being, as a rule, larger milkers, consequently yield more butter, but the quality of that made exclusively from their milk is not quite equal, as it lacks something of its delicate flavor, to the best Jersey butter. This experience indicates, that one or two good Guernsey cows in any herd kept for butter, would probably improve its product as a marketable article. Some

size and general appearance—a fact which speaks strongly for the Guernsey type as one to be regarded by breeders of dairy stock of any kind.

Hints for Work.

Be Prompt now, when the days are shortening and the season for field work is rapidly nearing its end. Utilize every hour for securing the crops yet ungathered. Neglect no chance for putting the ground in order for spring work, but turn every fair day to account, that nothing be neglected.

Make a Note of what Remains to be Done.—There are a score of things to be done on every farm that may be considered of little account singly, but which in the aggregate make up a serious total. Every one should look about, note down what needs to be done, and frequently examine the record.

Cutting Corn.—Every day the corn remains uncut, after maturity, there is loss. Corn gains nothing by standing after the kernels are glazed, but the fodder loses rapidly in quality. Much of its digestible matter is changed into woody fiber, becoming hard and undigestible. The sooner it is cut and shocked, the sooner it can be housed in safety.

Corn Stalks are no longer to be considered as a waste product, good for nothing but to be trodden under foot. They are worth fully the cost of putting in the crop, if well saved and cured. When cut at the right time, and well cured, six dollars a ton is, by many, considered a reasonable estimate of their value for feed, when hay is worth \$10 per

Husking Machines have been much improved since first brought out. For a thousand bushels of corn it will pay to use a power husker. By and by, the thrasher-men will have machines to do this work, and shell the corn at the same time.

Grinding with the Husk.—Some of the steel and chilled iron corn-cob mills will grind corn in the husk. For cows, cattle, hogs, and mules (and perhaps horses, when it is carefully used), it may be thus ground, conveniently and economically. The corn may be cribbed in the husk, and used as required. If not perfectly dry, grind small quantities at a time, as it will heat if kept in large bulk.

Wheat may yet be sown south of latitude 40° or 41°, if done without delay. If the soil is well drained and in good condition, this late sowing may sometimes be better than earlier, as the crop is thus more likely to escape the Hessian fly.

Harrowing Wheat in the fall should only be done when the surface of the land is dry. No kind of cultivation should take place when the ground is wet. Experimental cultivation should be done as early as possible. Deep plowing is not needed. To kill weeds and mellow the surface are what is wanted. Harrowing may be done safely two weeks after sowing, and repeated twice or thrice. Then

Grass Seed May be Sown, but not before. It will take at once on the mellow soil, and soon get ahead of that treated in the usual let-alone manner.

Wheat and Grass Fertilizer.—Wheat needs nitrogen at this season, and so does the grass. 100 lbs. per acre of nitrate of soda would be a help to both,

Green Fodder for Spring.—Rye may be sown any time this month; the sooner the better for early spring feed. Sow thickly, 4 bushels per acre, and fertilize well. Where the winters are open, as in the border and Southern States, this will make excellent winter pasture and give a crop of grain or green fodder besides.

Mangels and Beets are injured by frost. These should be gathered and secured in pits this month, where frost is prevalent. The fresh leaves have an injurious effect upon cattle if fed in excess. A day or two after cutting, they may be fed safely—a pressed bushel-basketful at a time, sprinkled over with a handful of salt.

Turnips will resist considerable frost and grow rapidly in cool weather. If standing too thickly in the rows, thin out, using those removed as fodder. If fed to cows, they should be given at milking time. The flavor will disappear before 12 hours have expired, and will not materially affect the milk.

Horses that have been on pasture, should now be taken up at night, and have some dry feed.

The Change of Feed, from green to dry, should be gradual with all stock; otherwise, the appetite may fail, and the animals lose thereby.

Milking Cows can not be kept in full flow without ample rations of fresh fodder. As the pastures become bare, newly eured corn-stalks, cut and mixed with chopped roots and sprinkled with middlings, and ground corn and oats, may be given. Liberal feed always pays with the right kind of cows.

The Aim in Feeding, now, should be to get the stock into good condition before cold weather, remembering that an animal beginning the winter well, is as good as half through it already.

Sheep, if fed liberally, and managed carefully, are most profitable stock. The better we do for them, the better they will do for us; badly managed, they are likely to prove a failure.

For March Lambs, the ewes should be coupled this month. The best ewe is a common grade Merino, or native sheep. For the earliest, those which come from Ohio, or Western Pennsylvania, weighing about 90 to 100 pounds, are excellent for this purpose. A pure South-Down ram, and next, a Hampshire-Down, and next, a Cotswold, is the best animal to cross upon these. A plump, fat lamb of moderate size, will bring more than a "scrawney" one half as big again. The black face and legs of the "Down" breeds are desirable in market lambs.

Feeding Sheep for Market, is a profitable business for those who have judgment to buy well, to feed well, and to sell well. Two profits can easily be made: A big manure heap, and good pay for feed and care will be returned to the skillful feeder. For more detailed information, "Stewart's Shepherds' Manual" may be consulted.

Winter Rape, for winter and spring feeding for sheep in the South, may be sown early this month. Five pounds of seed per acre, if planted in drills; or if broadcast, 8 pounds will be needed. It may be fed off by penning the sheep upon the crop as soon as it has sufficient growth. The surplus may be plowed under in the spring as an excellent preparation for oats or corn. This has been grown advantageously for this purpose as far north as Rochester, N. Y., the sheep even leaving a warm shelter and pawing away the snow to find it.

Swine.—Brood sows should be well fed now, so that they will be in good condition for coupling next month for March pigs. Grades or half-breeds of any good breed are more profitable than full-bloods for the farmer. Keep no pig over a year old for fattening, if the most profit is looked for.

Feeding for Pork, may best be begun at once, using up the soft and poor corn first. Some feed green stalks, cut fine, and mixed with meal; this will bring the pigs into a thrifty condition, to be finished very rapidly in November.

Full Pigs, may be carried over on skim milk, a few cut corn-stalks, potatoes or roots, with a little bran, and plenty of fresh water.

Water.—It is a great mistake to stint animals in water; 75 per cent of their weight is water. Digestion cannot go on without it. Water is therefore

food in one sense, and an ample supply should be provided for every animal to drink when inclined.

Poultry.—If eggs are expected during the winter, they must be provided for now. Dispose of the old hens; select as many of the best young pullets and feed them well. Give wheat soaked in hot water, once a day. Barley, buckwheat, and corn, in equal proportions, may make the rest of the food; chopped cabbages will help. Provide clean quarters, plenty of water, gravel, old mortar, and charcoal. Make the house warm; do not crowd too many into it, and a good supply of eggs will result.

Notes for the Orchard and Garden.

In many portions of the country, there has been such an excess of rain, that artificial watering has not suggested itself. The summer of last year, as well as the one just past, having been unusually moist, there is the greater probability that the coming one will be dry. There are few localities that do not have their years of drouth, and when the facilities are at hand, there should always be provision for irrigation. It may be that watering will be really needed but once in three or five years; it is this uncertainty that makes it all the more necessary to be prepared for drouth when it does come. Every experienced fruit grower has known seasons when an abundance of water would have given him a yield of strawberries, the profits on which would have paid for a much larger outlay than is ordinarily required to provide means to irrigate the whole garden; and so with other crops. In our uncertain climate, the control of water in both directions is necessary to the best success. Ability to remove excess by drainage, and to supply the deficiency by irrigation, give the enterprising cultivator a great advantage over the one who "takes things as they come." This is a most favorable month for all work requiring the removal of earth, and such improvements as road making, grading, etc., are not only more sure of being made, but they will be better done now than in the busy, but often cold and cheerless days of spring.

Orchard and Nursery.

Last month's Notes on fall planting, are timely now. With some fruits this is a year of abundance, and as usual in such seasons, only the best fruit sent to market in the best shape will pay

Freight and Charges, which are likely to be as much on a barrel of poor fruit, as on one of the choicest. While the poor fruit may be turned to account at home, if only fed to the pigs, when sent to market, it may bring the shipper in debt.

Apples are generally barreled in the orchard as they are picked, but the long keepers are considered to keep better, if allowed to lie in heaps two or three weeks before barreling; the skin toughens, and they lose some moisture. We generally advise making two sorts for market, and a third to be kept at home. When fruit is so abundant as now, the "seconds" will hardly sell at all.

Firm Packing is essential; when the barrel is half full shake gently, just enough to settle the fruit; do the same when the barrel is nearly full, and put on enough by hand to form a level layer—projecting sufficiently to require strong pressure to bring the head to its place.

Barrel Presses, working with a screw, are sold at the agricultural ware-houses, or a lever may be rigged to answer the purpose. The fruit must be pressed so firmly that it will not move in handling. Mark the opposite head, as the one to be opened.

Winter Pears are similarly treated; choice table kinds are generally packed in half barrels, and very select specimens, in shallow boxes, holding a single layer, each pear wrapped in tissue paper.

Quinces are packed in barrels or crates; handle carefully to avoid rubbing off the bloom, and mark on the package the number of quinces, as in most markets they are sold by the hundred.

The Fruit Cellar should be in readiness, but the fruit may be kept under a shed or elsewhere until there is danger of freezing. In storing, put the

barrels of earlier ripening sorts nearest the door. Provide ample ventilation under control, and tight, easily managed windows shutters; in mild weather, open at night and close during the day....In seasons of abundance, much fruit will be made into

Cider, especially as a step towards vinegar. As the richest juice makes the best cider, so the better the cider the finer the vinegar, though poor fruit will make a better article than is usually sold. Those who make vinegar only occasionally will hardly be at the expense of a special building for it.

Patent Vinegar Processes are advertised, some of which are merely well known directions sold at a high price, and come very close to being frauds—we have no confidence in any of them. On the other hand, some of the vinegar-making devices we have known are useful. To make good vinegar

The Essentials are: good cider, a temperature of about 70°, and as complete exposure to the air as possible. The devices offered act upon the principle of exposing cider to the air in shallow trays. A cask half filled with cider, with bung out, in a warm room, will become vinegar much sooner than a full cask, bunged up, in a cool cellar.

Vinegar-making is a sort of fermentation greatly facilitated by a kind of low microscopic plant, popularly known as the "mother" of vinegar. Placing cider in old casks containing this, and mixing cider with old vinegar, hasten the process.

Pomace is usually thrown in a heap where it remains a nuisance for a long time. Cattle and pigs will consume a little of it, but there is not much nutriment in it, and it is better to break it small and put it in the manure heap.

Heeling-In may be done in such a manner as to greatly injure young trees, but if properly done the objections often made to the practice have no weight. As a general rule, if one is at a distance from nurseries, and intends to plant in spring, it is better to procure his trees in autumn, heel them in, and have them at hand ready to plant in spring. The trees are likely to be taken up with better roots, and the risks of injury in transportation are less. Heeling-in consists merely in burying the roots and parts of the stems of the trees in a dry mellow soil. If set upright they are more exposed to the weather, but there is less danger from mice than if slanting. The usual method is to open a trench, lay in the trees in a sloping position, and fill in with earth. See that no unfilled spaces are left around and among the roots, and that the labels are all right, and finish off with several inches of soil patted well with the spade.

Various Matters.—*Top-dress* the Orchard with fine manure this month, or later....Leave no dead weeds, grass, or other rubbish near young trees to harbor mice....Recently planted trees should have a conical mound of earth, about a foot high, around them.

Fruit Garden.

Last month's Notes are mainly seasonable now. It is often well to protect plants that are really hardy, the protection being not so much against the severity of the cold as the sudden alternations. This being the case, the protecting material must not be applied too early, it being quite soon enough when the ground begins to freeze.

Strawberries are sometimes injured by too much covering; the straw, marsh hay, or other material, should be placed freely upon the soil, but only an inch or two thick over the plants themselves.

Raspberries of tender sorts are laid down and covered with a few inches of earth. This is quickly done by two men—one to bend over the plants and the other to put on the soil.

Grapes.—See directions for picking already given. We are often asked how to keep this fruit. Many tons are sent to market for the holidays, preserved by boxing them, as described last month, and keeping in an even temperature just above freezing. It must be borne in mind that there are good and bad keepers among grapes, as there are among apples and pears. The Concord, for example, will keep but a short time under any conditions; Delaware is somewhat better; Diana is one of the longest

keeping, while Catawba and Isabella are excellent in this respect, tous being preserved every year.

Pears.—The treatment of winter fruit is mentioned under Orchard. That upon the shelves of the fruit-room needs frequent examination, that those in proper condition may be used when ready.

Kitchen and Market Garden.

In many localities the garden will go into "winter quarters" this month, and where this is postponed for a while, operations should be made in anticipation of the first heavy frosts. Tropical plants, like tomatoes, Lima beans, squashes, etc., succumb to the first frost; beets, carrots, celery, etc., are less sensitive, while parsnips and salsify endure the coldest weather without injury.

Cold Frames should be made ready for cabbages, cauliflower, and lettuce. Choose a spot of light and dry soil, in a sheltered place; if no spot protected by a fence or building is available, a temporary fence may be put up at the north side. If the plants are only to be protected, and are not expected to grow, a very rich soil is not needed. If the frames are to be used afterwards for growing plants, then the soil should be well fertilized; in any case it should be spaded and made fine, removing all stones, etc. The rear of the frame is a plank, 12 inches wide, and the front 8 inches, and far enough apart to accommodate the sashes; the length will be governed by the number of sashes; the ends are closed by properly shaped pieces of plank. It is well to place strips from front to rear where each two sashes meet, for these to slide upon; the ends of these slides are dovetailed into the edges of the front and rear planks, and it is convenient to have a narrow strip placed lengthwise in the center of each, to separate the sashes, and allow them to run regularly, when moved upon them.

Pricking out the Plants is done from the middle of this month to the middle of next. They are set 2½ to 3 inches apart each way for cabbages and cauliflowers, and 2 inches for lettuce. The first two must always be set in the soil down to the first leaf, to protect the stem, the earth being pressed firmly about them. Water, and if the sun shines, shade for a day or two. The sashes will not be needed until there is freezing cold weather. In Virginia and southward,

Ridges supply the place of cold frames for cabbages; the soil is thrown up into ridges a foot or more high, running east and west. Instead of setting the cabbage plants in cold frames, they are planted in November on the south side of the ridges; in very cold weather cover lightly with straw or litter. As the plants are to grow here, the soil between the ridges must be well fertilized.

The Storing of Roots and other crops must be provided for. The plan of filling up the cellar of the dwelling with various kinds of vegetables is objectionable. Small quantities for immediate use may be kept there, but the bulk of them should be stored elsewhere. Roots for table use should be placed in the cellar in bins, boxes, or barrels, with sufficient earth among and over them to prevent shrivelling. If there is no root cellar, the plan of storing in pits or trenches is an excellent one.

Pits for Roots must be made where water will not stand on the bottom; they are dug 3 or 4 feet deep, 6 feet wide, and as long as needed. The roots are stacked in these, beginning at the end of the pit, and fill 2 feet of its length; a space of 6 inches is left, and another section of 2 feet is built up, and so on, in each case piling the roots up to the ground level; the spaces are then filled in with earth, and the pit will present a series of sections of 2 feet of roots, and 6 inches of earth. The roots are covered lightly at first, but when cold weather comes, put on about 2 feet of soil, rounded and smoothened, to carry off water.

Harvesting of Roots should not be done until the growing season is quite over. Beets and carrots have their sweetness injured by hard frosts; turnips may remain until there is danger of freezing; parsnips, salsify, and horse-radish being perfectly hardy, many dig of these only what will be wanted

while the ground is closed, thinking that they are improved by freezing.

Sweet Potatoes are to be dug as soon as the vines are touched by frost, and allowed to dry in the sun; large quantities are kept in houses that can be warmed to a temperature of 60°. Small quantities may be kept in a warm closet or other warm place.

Squashes will not keep if the least touched by frost. If a frost is threatened, gather and place in heaps, and cover with the vines. Handle with great care not to bruise them, and store in a warm place.

Tomatoes.—The season may be prolonged by covering a few vines with a barn-sheet or other cloth, to carry them through the first frost. If the partly ripened ones are picked and placed in a greenhouse or frame, or a sunny window, they often ripen up.

Celery should have the stems brought up together, and the earth, first loosed with a hoe, brought to and pressed around it with the hand, sufficient to keep the leaves in an upright position. This "haudling," as gardeners term it, is all that will be needed for the portion to be stored for winter; that wanted for early use must be hanked up with earth, quite to the tops, using the spade for the work. In the climate of New York, it is not stored for winter until next month.

Spinach and Sprouts, in order that they may be of a good size to winter over, need frequent hoeing so long as growing weather continues.

"*Making Garden*" is usually put off until spring, but the work should be commenced now by manuring and plowing wherever the crops are off. If new land is to be added, or a new garden made upon land in grass, apply a liberal dressing of manure and turn under the sod.

Et cetera.—Gather up all refuse and take to the pig-pen or compost heap, as may be.... Burn all weeds that appear seedy.... Provide covering material, such as leaves, marsh hay, etc.... Gather sweet-herbs, tie in small bunches, and hang in an airy place to dry.... Chickweed, common in the older States, will flower and produce seeds when not actually frozen—clear it off.

Flower Garden and Lawn.

In last month's Notes, we made some reference to the destruction of lawns by the "white grub." Since then we have seen most melancholy evidence of its ravages. In some parts of New England, especially near Boston, the owners of fine lawns are well nigh discouraged. The "white grub," the larva of the "May-bug," "June-bug," or "Dor-bug," as it is variously called, has utterly ruined the turf. These grubs work just at the surface of the soil, eating the roots of the grass as they go, so that large sheets of turf may be lifted as if it were a blanket. As grubs they last three years in the ground, and these appear to be in their second year. So numerous are they that 12 bushels were taken from one place that we visited. The trouble was not discovered until the work was done; had the presence of the grubs been known early in the season, frequent rollings might have saved the grass. Of course the only thing to be done was to make the lawn anew. Some made applications of alkalies and acids, and think they have saved their grass; such are deceived by the growth of annual grasses, such as Crab-grass, (*Panicum sanguinale*), Barn-yard Grass (*Panicum Crus-galli*), and other late comers. The only remedy is to remove the remains of the old turf, gathering and killing the grubs that are found, prepare the ground, and seed anew. Crows, blackbirds, and other birds were constantly at work, digging for the grubs, and though they destroyed many, the proportion, as compared to the whole, was small. It is impracticable to attack the insect in the grub state, as it is hidden from sight, but there must be a combined effort to trap and destroy them in the perfect state of beetles, else this severe loss may occur again. It is no small expense to relay 10 to 20 acres of lawn—besides, these grubs do not confine themselves to grass alone, but feed upon almost every growing thing that comes in their way.

Chrysanthemums to bloom in-doors, should be potted, and those to remain in the open ground will need stakes before the severe storms come.

Spring Bulbs should be planted as soon as they can be had from the dealers. Those who are not fanciers, but wish a general effect, without regard to names, can buy assorted Hyacinths, Tulips, etc., by the dozen, of the dealer's selection, much cheaper than named kinds. Double Tulips are very showy, they make a blaze of color, and are deserving of more attention than they receive.

Bulb Beds need a light, open, and very rich soil; the general rule is to put the bulbs below the surface to a depth equal to their own thickness.

Crocuses and Snow Drops may be put in patches here and there in the grass, and left to themselves.

Old Bulbs.—Those which were taken up from the beds last summer, and those that flowered in pots, will never bloom so well again; these may be planted in clumps here and there in the edge of shrubbery and in the border. Their flowers, while far below the "standard," are very useful for cutting.

Protection from Frosts.—In the climate of New York, we usually have two or three nights of frost at first, and then some weeks of the finest possible weather, and it pays to be at some trouble to protect tender plants during these early frosts; a light sheet, or even newspapers, if over beds of coleus, cannas, geraniums, etc., will save them from these first frosts, and much prolong their bloom.

Cannas do not keep so well if the foliage is killed by frost, and to have sound roots the tops must be cut away as soon as they are slightly tipped.

Dahlias.—When the foliage is killed, cut away all above ground, and leave the roots until a bright, warm day; then dig them early, handling carefully, as they break easily; fix the label securely to each, and allow them to dry in the sun all day. Store in a place that will keep potatoes in good order.

Tender Bulbs, like Tiger-flowers, Gladioluses, etc., must be lifted before the ground freezes, and stored in a cool, dry place. Tuberoses that have not yet flowered, or have yet many buds, may be lifted and put in boxes of earth; placed in a greenhouse or sunny window, they will finish blooming.

House Plants, if any are still in the borders should be taken up without delay. See article on "Preparing for Winter," on p. 352.

A covering of leaves, straw, or littery manure, while not absolutely needed, may be given to most hardy herbaceous plants with benefit; it will cause a stronger bloom in the spring, while it will be of great service to those that are barely hardy.

Leaves should be raked up not only as a matter of neatness, but for the sake of the leaves, which are one of the best possible covering materials.

Greenhouse and Window Plants.

The chief work with these, is to prepare them for their winter quarters, as indicated last month, which is supplemented by an article on a subsequent page (382), and these together give about all that need be said on preparing for winter.... We must emphasize the necessity for a

Gradual Change from the open air to the confinement of the house. Plants in the greenhouse and in windows, should have full air on pleasant days.

Plants for Forcing.—Many of the early blooming plants, including shrubs, force readily, even in window culture, and give an abundance of bloom in February and later. Among the most useful are Perennial Candytuft; Bleeding Heart (*Dicentra*); Japan Astilbe (incorrectly, *Spiraea Japonica*), and Lily of the Valley, among herbaceous plants, and in shrubs: Slender Deutzia, Thunberg's Spiraea, and even small plants of Weigela, Forsythias, and Dwarf Lilacs may be used where there is room. These should be taken up and potted as soon as growth ceases, and placed in a cool cellar or in a pit where they may freeze, if it so happens, without injury. The end of December or early in January, is soon enough to bring them into a warm room.

Bulbs may be grown in water, if one fancies, but the bloom is never so satisfactory as from those potted in rich soil. Pot early in good garden soil enriched with cow manure, and add enough sand to keep it open. The catalogues give descriptions of the various bulbs, with full details on their culture.

Commercial Matters—Market Prices.

Gold has been up to 100 1/2, and down to 100 1/4, closing Sept. at 100 1/2, as against 100 1/2 on Aug. 12; 100 1/2 July 13; 100 1/2 on June 13; 10 1/2 on May 13; 100 1/2 on April 17; 10 1/2 on Jan. 12; 103 on Dec. 12; 102 1/2 on November 12; 103 on October 12; and 103 1/2 on Sept. 12, 1877. Business in Breadstuffs have reached extraordinarily large proportions, during a month the receipts, sales, and shipments of grain, having been in magnitude, beyond precedent. The export operations were mainly in Winter Wheat, and winter wheat products, for French markets; in Oats, and Rye for France and Germany; in Corn for British ports; and in Flour for British, French, West India, South American and Provincial markets. Some important purchases of grain were also made for foreign markets, not usually supplied from this source. As to the activity, nothing more satisfactory could have been hoped for. In the way of prices, however, the opposite was quite generally true. Wheat, Flour, Rye, and Oats having yielded in value, under the increased and urgent offerings, the most serious fall occurring in wheat, especially winter grades of the new crop, which constituted the bulk of arrivals. Spring Wheat of the old crop was unusually scarce, and held with remarkable firmness, while of the new crop, very light receipts were reported, and consequently but little animation. Foreign advices at the close, are decidedly unfavorable to the export movement, which was lighter in volume. The unusually full supply of foreign exchange and consequent depression in rates also worked against shippers. Provisions

have been fairly active; but hog products declined materially. Cotton has been quoted lower, on a restricted business. Wool has attracted less attention, and has been quoted weaker in price. Seeds have been more freely dealt in; rough flax advancing, on moderate offerings; while Timothy receded, on augmented supplies. Hay and Straw were in fair request, especially the better qualities, which were held pretty firmly. Hops have been in very light demand, and quoted depressed and irregular in price. Tobacco and Naval stores were moderately active and steady. Groceries have been in comparatively brisk demand, and generally stronger.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, from our record kept daily during the year, show at a glance the transactions for the month ending Sept. 12th, 1878, and for the corresponding period last year:

1. TRANSACTIONS AT THE NEW YORK MARKETS.

RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.

Bees.—Trade was slow and dull at the beginning

of the month's business. Heavy receipts, unsold stock left over, and a light demand, together broke the market, and prices gave way. An improvement in the foreign export trade, with lighter receipts, helped to restore business somewhat, but it has dragged and fluctuated all through the month. At the close, low grade stock fell off fully 1/2 c. #10, but good steers advanced quite as much, and so kept up the average. The closing prices were 7 1/2 c. #10 for low grade stock of 55 lbs. to the cwt.; 7 1/2 c. to 8 1/2 c. for fair steers of 55 to 56 lbs.; 8 1/2 c. to 10 c. for prime steers of 56 lbs., and 10 c. to 11 c. for extra, estimated at 57 to 58 lbs., dressed, to the cwt. live weight.

The prices for the past four weeks were as follows:

WEEK ENDING Range. Large Sales. Aver.

Aug. 19. 6 1/2 @ 10 1/2 c. 8 @ 10 c. 8 1/2 c.

Aug. 26. 7 1/2 @ 10 1/2 c. 8 @ 10 c. 9 c.

Sept. 2. 7 1/2 @ 10 1/2 c. 8 @ 10 c. 9 c.

Sept. 9. 7 1/2 @ 10 1/2 c. 8 @ 10 c. 9 c.

Cows.—Little business has been done in cows; the

demand is light and receipts have been fully up to the wants of purchasers. At the close of our report there was more inquiry which led dealers to advance prices a few dollars per head. Sales have been made from \$35 to \$50 per head, according to quality.

Calves.—The market has been firm and active

through the month, prices closing without much change at 30 1/2 c. for grassers, 3 1/2 c. to 2 1/2 c. for buttermilk, 4 @ 1 1/2 c. for fed, and 5 @ 7 c. for veals. The pick of the lot went for 7 1/2 c. #10 live weight.

Sheep.—Fair quality sheep have been firm and in

demand: poor stock have been dull and neglected. Sheep good enough for export have brought 5 @ 5 1/2 c. #10; the range being from 4 @ 1 1/2 c. for prime stock. Lambs sold for 5 1/2 @ 5 1/2 c. #10; all live weight. Good Store Ewes from Ohio and Western Pa. sold for 4 1/2 c. #10 for 82 to 84 lbs.

Swine.—Live hogs have been steady at 4 1/2 @ 4 1/2 c.

for good; rough stock sold for 3 1/2 c. #10. City dressed active at 5 1/2 @ 6 c. #10. Light pigs in good demand at 6 c.

The Horse Market.—But little has been doing in horses. A few droves of thin rough animals have come in, and sold for an average of \$125 per head. A good work-horse, 9 years old, of 1,150 lbs., brought \$130; a fine black mare, well built, sold for \$150. Some fine French Stallions have been imported; but this business promises to fall off in the future. As with other imported stock, our home-bred animals are surpassing them, and the tide is full, to turn the other way in all probability before long. 31 light carriage-horses went from Canada through New York to Glasgow last week.

all kinds of dairy implements, designs and models of barns, milk-houses, creameries, cheese-factories, etc. The exhibition of specimens of typical dairy stock, from various herds, is under consideration, but is not yet decided upon. The Secretary reports a very favorable response from all sections of this country, and from Europe, and the prospect is good for a successful exhibition. The purpose of the fair is to stimulate this industry, and show our dairymen its immense possibilities. It is estimated that the product from the cows of the country exceeds five hundred million dollars annually. Recently in a single day 42,000 boxes of cheese were shipped to Liverpool for the European market, and the exports of butter from the U. S., during the year ending June 30th, 1878, amounted to 21,834,141 lbs., and a value of \$3,930,840; the previous year to 21,527,212 lbs., valued at \$4,421,616. Cheese for the corresponding periods amounted to 123,783,736 lbs., having a value of \$14,103,529 in 1878; and 107,364,666 lbs. in 1877, valued at \$12,700,627, which is a rapid increase, especially for butter, over previous years. Yet the trade is but partially developed. If the proposed fair shall help dairymen to appreciate this fact, and teach them how to meet the increasing demand with better products, it will result in great benefit to the industry and to the country.

A Strange Way.—A letter comes and we read: "Will you please give me the name of the enclosed fruit."—As the letter contains nothing, we propose to write to the sender that he has forgotten to inclose his specimen, but on turning over the leaf find it signed "Monmouth."—Let us sum up the result of this utterly useless custom of omitting the name in writing to an Editor. "Monmouth" wastes paper, envelop, stamp, and time occupied in writing; he has a tree of which he knows but a single one, he wishes to know the name, but carefully hides himself in "Monmouth," so that we cannot reach him. Our interest in so rare a tree is excited; we too would know what it is, but are unable to take another step. We are put to the trouble of writing this item, which the person in question will not see until October, and quite too late to repair the omission.

Cleaning and Burnishing Iron.—Mr. E. N. Jennins, of Cornwall, N. Y., an excellent horse trainer, recently showed us a contrivance in use in the Prussian army, for polishing the bits, stirrups, and other parts of the harness or trappings made of iron. It is simply a piece of hardened steel, 4 or 5 inches long, inserted in a handle, as shown in the engraving. The cross section is an oval; or, if round, it would probably do just as good work. It is made of $\frac{1}{8}$ -inch steel, with the surface smooth and polished. To brighten a tarnished or rusty

AN IRON POLISHER.

piece of iron or steel, the instrument is simply rubbed vigorously upon it, making it bright and clean in a short time. Where there are facilities for the work, an old, half-round file may be readily ground and polished to form a similar burnisher.

Invitations to Fairs, have, as usual, been received from every section by the Editors. But the number has been so large, and our work so pressing, that we have been compelled to decline all, save a few to the largest, or more representative of these exhibitions. We thank the many friends who have thus shown their interest in the *American Agriculturist*. We look upon these fairs as among the best experiences of the farmer's year; and we preach according to our practice, when we advise every farmer to attend all he can of them.

Is a Leg of Mutton a Sail?—"H. C. W.," of Westport, Ct., asks if it is "against the law to chase wild ducks in a row-boat with a 'leg-of-mutton sail,' the law prohibiting any vessel propelled by steam or sails." Now, if a "leg-of-mutton sail," is a sail, then it must be against the law to chase ducks with a boat so propelled. The important point is, whether "a leg of mutton" is a sail. The law evidently intends that no means shall be used to propel a boat, which will beat the ducks; hence, we suggest that you try the "leg-of-mutton" on the ducks, and if you catch them, to conclude it is a sail; if you do not, then keep on chasing them. Yet, the law only mentions "chasing" ducks, not catching them, so that won't work. Suppose, as a last resort, a convention of leg-of-mutton-sailors and ducks, i. e., of chasers and chased, be called to decide whether a "leg-of-mutton" is a sail. If that does not decide the point, ask us again.

Difficulty with Plums.—"O.," Homer, N. Y., has trees which bloom and set full, but an insect stings the fruit; he has tried lime and ashes with no effect; thinks that bottles of sweetened water have done some good, but he wants a "cure." It is the old story over again of the Curenlio, which we have told so many times. Yet it is still new to some. The bottles of sweet-

ened water may have caught many insects, but probably few of the guilty ones. Though innumerable experiments have been made, no application has been found to prevent the attacks of the Curenlio. Where this insect abounds, plums cannot be had, unless the trees are shaken, after the fruit sets, at first every morning, and as often thereafter as the number of insects caught shows the necessity for it. In the morning the insects are torpid; a sudden jarring of the tree will cause them to drop; they are caught upon a cloth spread for the purpose, and killed. This must be done, or no plums will ripen.

Covering Strawberries.—"C. H. S.," Sussex Co., N. J., protects his vines in winter by covering the ground between the rows with corn-stalks, bringing them close to the vines, and lays bean-poles across, to keep the stalks in place. This has long been followed in some of the Western States, and we give it now, to remind those who have not other material at hand, that corn-stalks will answer the purpose.

Surfeit in a Horse.—"P. L.," York, Pa. Horses are subject to a skin disease known as surfeit. This appears generally in the spring as small lumps, which break and exude a watery matter and then become covered with scabs. The irritation causes the animals to bite its skin or roll upon the ground, and in your case it lay and rolled in the spring to allay the itching which existed previously. This action most probably was not the origin of the disease, although a sudden chill may cause it. The treatment is to give one ounce each of sulphur and cream of tartar daily in the food for a week or ten days, repeating for another period if needed; and to wash the skin with water slightly diluted with sulphuric acid. One drachm of the acid to a pailful of water will be sufficient.

Weeds, Briars, and Brush, in Highways.

—The *N. Y. Law*, passed March 11th, 1878, reads:—§1.—It shall be the duty of every person, or corporation, owning, or occupying under a lease for one or more years, any cultivated or enclosed lands abutting upon any highway, to cause all noxious weeds, briars, and brush, growing upon said lands, within the bounds of said highway, to be cut or destroyed between the fifteenth day of June and the first day of July, and between the fifteenth day of August and the first day of September, in each and every year. But Boards of Supervisors may fix a different period, or periods, for such cutting or destruction in their respective counties. This section shall not be construed to restrict any of the powers heretofore conferred upon Boards of Supervisors. —§2.—It shall be unlawful for any person to place, or cause to be placed, any noxious weeds, or the seeds of such weeds, within the bound of any public highway. —§3.—Any willful neglect or refusal to comply with the provisions of section one of this act, or any willful violation of section two of this act, shall subject the person or corporation so offending to a penalty of ten dollars and costs in and for each road district in which any of these provisions shall be violated, to be sued for by the commissioner or commissioners of highways of the town wherein said road districts shall be situated, or by the street commissioner of villages, when such village constitutes a separate road district, and recovered before any Justice of the Peace having jurisdiction; said fine, when collected, to be paid into the highway fund of such town or village. —§4.—It shall be the duty of commissioners of highways of towns, or street commissioner of villages to prosecute every person or corporation violating any of the provisions of this act in their respective towns or villages, and to include in each annual report of such commissioners a detailed statement of all fines recovered under the provisions of this act.

Plaster on Wheat.—"A. S.," Blair Co., Pa., says we recommend certain artificial fertilizers on wheat, but that they cost too much, and asks if it would not be a good plan to sow plaster after the wheat is sown. We have advised the use of fertilizers, because, if used intelligently, they increase the crop more than enough to pay the extra cost, and thus are profitable. Plaster which is a fertilizer, may frequently help the crop somewhat, but it contains only lime and sulphuric acid, and cannot supply nitrogen, phosphoric acid, and potash, which are generally most useful to wheat, particularly the first two. Plaster is, on very many soils, very helpful to clover.

The Best Fowls for Winter Laying.—"F. G.," Fort Erie, N. Y. The Light Brahma has the best reputation for the production of eggs in the winter. It is a matter of doubt if this breed is not surpassed by the Leghorns. But the Brahma has other good points which the Leghorn has not, and this probably gives the former the advantage.

Preparing a Heifer for Exhibition.—"J. W. P.," Marshall, Texas. It is hardly possible to bring a very young animal into what is called "show condition" by feeding. If overfed it becomes sickly, poor, and miserable; its digestive organs are unable to dissolve the excess which goes into the intestines in a crude form, and causes disease. A calf of 10 weeks old can be brought into good healthy condition by feeding about 6 quarts of new milk daily in 3 meals of 2 quarts each, and giving about a pint of mixed wheat, bran, linseed, and

oatmeal between times. A little fine hay or fresh clover may be added. With this feed the animal will not become fat, but will appear sleek, lively, and healthy.

North American Ayrshire Register. Vol. III, is received from its editors, E. L. and J. N. Sturtevant, South Framingham, Mass. This is an independent Herd-book, in which every animal is traced to importation, being in opposition to that of the "regular" Herd-book of the Ayrshire Breeder's Association, which is said to be less strict in its requirements of the animals admitted for record. The N. A. A. R. has the merit, that all who refer to it may be reasonably sure of the purity of the pedigree of the animals found therein.

Cooking for Milk Cows.—"A. T.," Milltown, N. B. Whether or not it will pay to cook the feed for 30 cows, is a matter of figuring; the value of milk and the cost of labor being the chief items in the calculation. There is a saving in the quantity of food used which will go towards the cost of the apparatus and the feed. If a man can be procured at one dollar per day, and the extra milk gained will be worth more than that amount, there will be a profit in it. One man can prepare the food for 30 cows, and have half his time to spare for other work.

A Combined Latch and Hasp, affording double security, is represented in the engravings. The

Fig. 1—A LATCH-HASP.

hasp is made to combine the convenience of the latch, by simply putting a strap over it, to hold it in place, as shown in figure 1. The staple (fig. 2) has a

Fig. 2.—THE STAPLE-CATCH.

raised portion on each side, to catch and hold the latch. By this simple device, a door to a box-stall, or other door or gate, which it is often desired to close quickly, may be shut, and firmly fastened without delay; additional security may be obtained by slipping a pin into the curve of the staple, as seen in figure 2.

A Cheap Boat.—"R. W.," of Russellville, Ky., will find a description of a cheap boat, "suitable for fishing on mill ponds," or similar purposes, in the *American Agriculturist* for November, 1876.

Can a New Breed of Fowls be Produced?—"M. M." There is no doubt of the possibility of producing a distinct breed of fowls by selecting some good common hens and a cock, and carefully selecting and breeding the progeny closely in-and-in so long as the process is successful. The Plymouth Rocks are an instance of this, and although from a variety of bloods, the breed, in about 6 or 8 years only, has become quite fixed and reproduces itself very true to feather and character in the hands of skillful and patient breeders.

Orchard Treatment.—"B. F. H.," Fairfax, Iowa, understands exactly what he wishes to ask, and knows how to put it in the clearest possible manner. Some would cover one or two pages in order to express the following: "Is it desirable to let hogs run in an apple orchard to keep the grass down? (1)—or would sheep be better? (2)—or still better to mow? (3).—Ans. (1). Yes, they will convert the grass into manure, and by eating fallen fruit, greatly diminish the insect crop. (2). No, swine are preferable. (3). No.

Visiting Farms.—A professional duty with every good farmer, in the early fall, is to visit some of the best farms in his county or State, and take a few field lessons in agriculture. The illustrated farm journal is very good, and pays abundantly. But there is nothing like a morning's talk with a live farmer among his stock and crops to stir up one's pure mind by way of remembrance, and put him upon improvements at home. If you have been thinking for years of draining a field, go to some farmer who has a job of draining on hand, or completed, and study the process and its results. Such visits are not only a needed recreation that a busy farmer is fairly entitled to, but profitable in many ways. They give new facts, show one improved implements and new methods of culture, and help to economize labor and make money. Think twice before saying you can not afford the time. Certainly you can not afford to do without these visits.

An Honor Well Bestowed.—The French Academy of Sciences at its meeting on July 29th last, elected our friend and contributor, Prof. Asa Gray, of Harvard, a corresponding member in the botanical section. The number of correspondents in all parts of the world is limited to 100, and when a vacancy occurs through death, there is an active competition on the part of the members of the Academy to secure the honor for their friends. It should be gratifying to Americans that the choice has fallen upon our first Botanist, and the fact that he received 32 out of 40 votes gives us a high opinion of the eminent good sense of the Academicians.

Eulalia Japonica.—M. Carriere has found a mare's nest. He has discovered that the plant sold as *Eulalia Japonica* is not a type, but a variety with striped leaves, as seeds from this have given plants with green leaves; he adds, moreover, that we can be sure that it will be the same with *Eulalia Zebina*. As we were the first to describe and figure both these grasses, and never had any idea that they were "types" or anything but varieties of a plant normally green, this seems rather strange, coming from the editor of the "*Revue Horticole*," especially as he does not seem aware of the fact that *E. Japonica*, the type, is a recognized and described species (see Mem. Acad. St. Petre, 1852—Trinin's Andropogoneum, p. 333), and as recently as December, 1876, we gave the new form as "*Eulalia Japonica* var. *Zebina*." Evidently our distinguished confrere does not read his *American Agriculturist* with proper care.

How Much Wool is Produced?—The U. S. Census for 1870, reported 28,477,951 sheep, yielding 100,102,387 pounds of wool, an average of about 3 lbs. and 9 ozs. per head. There are now probably a fourth more, or between 35 and 36,000,000 sheep. Great Britain has about the same number. The total wool clip of the world for 1877 has been estimated at about $\frac{1}{4}$ billion lbs. (1,500,000,000 lbs.), or over 1 lb. for each inhabitant.

Coal Mined in the World.—For the Paris Exhibition, a statement was prepared by John Pechar, of Tepitz, Germany, from which we condense the following striking, and very interesting figures, giving the estimated total production of coal for the year, 1876, throughout the world:

	Pounds.	Tons.	Per c't.
In Great Britain	298,953,537,850	149,476,769	47.4
United States	106,588,919,613	53,294,460	16.9
Germany	106,588,919,613	53,294,460	16.9
France	37,211,516,314	18,605,758	5.9
Belgium	31,535,183,317	15,767,591	5.0
Austro-Hungary	29,643,072,318	14,821,536	4.7
All of Asia	9,174,480,000	4,587,240	1.5
Rest of the World	11,008,037,327	5,504,019	1.7
Total	630,703,666,352	315,351,833	100.0

[We reckon by the American ton of 2,000 lbs., though at the mines, and in large dealings here, a ton of coal is 2,240 lbs., the same as everywhere and for everything in Great Britain. The metric ton in France is 2,304 lbs.] It will be noted that nearly half (47.4 per cent) is mined in Great Britain; that the United States and Germany are each credited with the same amount, about one-sixth; that little Belgium nearly equals France, and yields more than three times as much as all of Asia. The annual product for all the world is about 500 lbs. for each inhabitant; for the United States, it is 2,422 lbs. for each of 44 million inhabitants.

The Iron Product of the World, for 1876, is given by Mr. Pechar (above named), as 31,571,460,276 lbs., or 15,785,730 tons of 2,000 lbs. The coal mined is about 20 times the weight of pig iron produced. The ratio of production in the leading iron producing countries is nearly as follows: Great Britain, 46; United States, 17; Germany, 34; France, 10 $\frac{1}{2}$; Belgium, 3 $\frac{1}{2}$; Russia, 3; Austro-Hungary, 2 $\frac{1}{2}$; Sweden, 24. (The iron product of the United States for 1876 (5,330,719,707 lbs.), or about 125 lbs. for every inhabitant....Of *Bessemer Steel*, the product for 1876, is stated at 4,616,873,336 lbs., or 2,323,436 tons, of which one-fourth was made in the United States, a little over one-third in Great Britain, not quite one-fifth in Germany, and one-tenth in France. The total steel made in 1876 would lay 22,116 miles of railway track, allowing 20 lbs. to the foot of rail. The present rate of production would put steel rails upon all the railways in the world in less than ten years.

Glue Scrap.—"J. L. T.," Butler Co., O. By composting glue scrap with barnyard-manure, for three to six months, an excellent fertilizer will be the result, as the material is rich in nitrogen. It is hardly comparable to stable-manure, for though it has more of the valuable ingredient, nitrogen, it contains little potash or phosphates.

Wheat Bran for use as a fertilizer, is asked about by several readers of the *American Agriculturist*. Of the essential ingredients of a fertilizer, wheat bran contains about 2 $\frac{1}{4}$ per cent of nitrogen, 1 $\frac{1}{2}$ per cent of potash, and 2 $\frac{1}{2}$ per cent of phosphoric acid, which, together,

er, give a ton of the bran a value of full \$15.00 as a fertilizer—reckoning the nitrogen at 20 cents per lb., phosphoric acid at 10 cents, and potash at 7 cents—which are the value of these ingredients in commercial fertilizers. Rye bran has about the same value for use as a fertilizer. Where bran is cheap and abundant, it is sometimes applied to the soil as a manure, and, it is said, with quite favorable results. That this is a wasteful practice, is proven by the experiments of Lawes and Gilbert, who found that the manure resulting from the feeding of a certain amount of fodder to mature animals, contained nearly as much of the fertilizing ingredients as before passing through the animal; the reason being that the processes of digestion remove for fat forming only those portions which have little value as manure. The simple lesson, then, is to feed the bran to fattening animals, thus making it serve the double purposes of producing beef, and supplying good manure.

Our Wonderful Petroleum.—Twenty years ago this article was little known. The first artificial well was sunk in August, 1859, we believe. Now there is an annual production in this country of about 15,000,000 barrels, and more than sixty million dollars' worth are exported to other countries annually—our exports ranging in importance, according to valuation, 1st, Cotton; 2d, Flour and Grain; 3d, Hog products (lard, hams, and salt pork); and 4th, Petroleum. There are more than ten thousand oil wells flowing or being sunk; and probably over one hundred millions of dollars invested in the business, in one way and another. Fifteen million barrels (40 gallons to a barrel) of this earth-yielded oil, would fill 9,600,000,000 lamps holding half a pint each, or about seven such lamps for every man, woman, and child on our globe. If these lamps were equally distributed, so that every four persons could have one, and allow half a pint of oil to burn three evenings on an average (short nights included), the 15 million barrels of oil would light up the whole human race for a period of three months, or a fourth of the population of the globe for a whole year! All this has come to light, from the bowels of the earth in less than twenty years, during which time we have not only used all the petroleum we have wanted ourselves, but have sent to other lands nearly Five Hundred Million dollars' worth, at the low Custom-house valuation. What other stores of light and of comfort, lie yet undiscovered in this wonderful world of ours!

Expenses of the United States Government since its Foundation.—Recent investigations show the total expenditures for all purposes by the United States General Government, from its foundation up to July 1, 1876, to have been \$15,516,996,680,—almost exactly half of the estimated value of real and personal property by the Census of 1870 (\$30,068,518,507). The smallest expenses were in 1793, being about $\frac{7}{8}$ million dollars; the largest in the year ending July 1, 1865, when they were 1,906 million dollars. The \$15,516,996,680, if in dollar greenbacks (24 $\frac{3}{4}$ x 7 $\frac{1}{2}$ inches, or 23 square inches each), would carpet or cover 468,000 acres, or 730 square miles, or a little over one-third of the State of Delaware, or nearly one-tenth of Massachusetts. Some of the mathematical readers of the *American Agriculturist* may reckon how many acres would be covered if the dollars were in the new silver currency, touching at their edges; also how many tons of silver it would take, at 412 $\frac{1}{2}$ grains to the dollar, and 7,000 grains to the pound avordupois; how many teams to draw it, &c., &c.

Cyprus—Its Size.—Recent treaties bring into prominence the Island of Cyprus, in the Eastern Mediterranean, which has been taken possession of by Great Britain. Its area is 3,673 square miles, or 247 square miles greater than the combined area of Delaware (2,120), and Rhode Island (1,306); or about three-fourths the size of our next smallest State, Connecticut (4,750 square miles). The population of Cyprus is about 200,000, or not two-fifths of Conn. (537,454, in 1870), and a little larger than that of Florida (187,748, in 1870). It is nearly 100 miles west from the coast of Syria, and 300 miles from the entrance to the Suez Canal. The name Cyprus is from the Greek word *cuprum* (copper), so named from the ancient copper mines on the island.

Cistern without Stone or Brick.—"B. K. W.," Bay St. Louis, Miss. A cistern often may be constructed in the ground where the earth is clay, provided the inside is plastered with hydraulic cement; though of course such a cistern would not last so long as one made of stone or brick. At several places in the vicinity of New York most of the cisterns have no brick walls, but a heavy coat of hydraulic cement mortar is put directly upon the compact earth at the sides and on the bottom. The top is covered two feet below the surface, with locust poles and flat stones, leaving a man-hole at the center carried up by planks a little above the ground. They are often arched over with bricks when the soil is compact enough to support the arch, and many soils will

do this. The top of the cistern is made wider, three feet down, a coat of cement mortar put on—with flat stones if plentiful—and the brick convex arch stands upon this.

Pennsylvania Corn.—"J. C. P.," N. Orleans, La. The variety of corn grown in Pennsylvania having 32 rows upon the ear, is the Gourd Seed Corn. It is usually planted in hills 4 feet apart, sometimes more; 2 stalks are left in the hill, and generally but one ear or one large and one small one are produced upon each stalk. The stalks are not so large as those of the Southern or Western corn. Good farmers in Pennsylvania grow from 80 to 100 bushels of this corn to the acre. The manner of cultivation is to plow under a very heavy sod well top-dressed with barn-yard manure, and to use 300 lbs. of superphosphate per acre besides.

Abortive Ears in Corn.—"D.," We do not yet know the possibilities of the corn-plant. Five fair sized ears to a stalk is not uncommon. We are trying this year to grow more ears by extra fertilizing and pruning. There is no doubt that if the soil is made sufficiently rich, and the plants have room enough, and if they are trained to it by continued skillful selection, pruning, and cultivation, every abortive ear can be made productive. This can only be accomplished by long and patient work; it can not be done by a spurt or accident. The removal of abortive ears, and suckers, will doubtless throw more strength into the others. You may experiment hopefully in this direction.

Gilt-edged Butter.—"G. E. R.," and others. We can not give the names of any persons purchasing gilt-edged butter. The number of customers for butter at a dollar per pound, is very limited, and we doubt if those persons who sell butter at very high prices make a corresponding profit, considering the expenses incurred. Probably the best way to get good prices would be to put up first-class butter in neat packages, marked with the maker's name, and sell it through a commission agent for a time until a reputation is gained, and then gradually work into such a connection as may be deserved. No extra price can be procured except for a stated supply at all seasons, and of an unvaryingly good quality.

Cows Eating Wood, Bones, etc.—"C. M. F.," Trenton, N. J. When cattle eat bones, leather, wood, etc., it indicates a lack of phosphate of lime in their food, which they require to supply bone material and wastes of the system, and the 100 lbs. or more which every cow requires in a year for her milk. Lack of this in the food, creates a morbid appetite, which is only partially satisfied by gnawing at such objects. Bone flour may be fed in its grain to each animal at the rate of a teaspoonful per day. A good dressing of superphosphate or bone-meal on the upland pastures, will stimulate the growth of such plants as furnish the missing ingredients.

Okra Soup.—"Mrs. J. J.," Clark Co., Va., referring to a note upon the uses of Okra, in August *American Agriculturist*, says that when the sliced Okra is added to the soup: "The mucilage in the young pods will create a foam that is almost impossible to keep under control. To obviate this, slice the pods into sufficient water to cover them; in an hour or more, squeeze out with the hands into a skillet or shallow pan containing a very little lard, and fry until the gummy matter is killed. A little observation will soon determine that fact. Be careful not to brown or scorch. Turn the fried Okra into the soup kettle and let it boil at least an hour in the soup, as it should be perfectly soft when served. Add a generous amount of tomatoes to the soup, as they are a decided improvement, and "Okra Soup," according to Southern usage, should be quite thick. As in all vegetable soups, I think it an advantage not to have the stock too rich. When made with chicken as a basis, a small piece of ham or bacon improves the flavor. In using the dried "Okra" soak several hours in tepid water, and then fry as directed for the green. It requires more boiling in the soup than the fresh, and, although not so finely flavored, still is a valuable addition to our winter soup vegetables."

"Compulsory Education."—To "Individual Rights." It is out of the scope of the *American Agriculturist* to discuss with you the "injustice of compelling education arbitrarily," but here is a thought or two. No parent has a right to send into the community a child with an infectious disease, or one viciously inclined. The State has to take care of such cases for the protection of the people at large. Ignorance is the parent of vice. The foundation of power, of civil rights, is with the mass of citizens. Education refines the feelings, strengthens the moral powers, enables one to think and judge better, improves the understanding, and makes a better citizen. Is it not the duty of the State to require what will lessen its care and expense for the vicious; to compel an education that will improve its own condition, its source of power, its safety from crime and revolution?

While this education may and should be left mainly to the parent, if the parent neglects to give it to the child through ignorance, or carelessness, or inability, should not the State provide and compel it—not only for its own protection, safety, and best good, but in justice to the child itself? It seems to us that every child should have a knowledge extending to Reading, Writing, Arithmetic, Geography, and the History of our own country. Prussia adds to these requirements, and well, we think, Drawing, Music, and Gymnastics. It takes care that every child has these acquisitions from the parent if they will and can supply them; otherwise the State furnishes them, and sees to it that they are obtained by every child not an invalid or idiot.

The New York State Fair, held at Elmira, Sept. 9-13, was, taken as a whole, as good an agricultural fair as we ever attended, and it was said to quite equal any ever held by this leading Society. A marked feature of these exhibitions is the absence of horse trotting, and the fact that nearly a fourth more money is offered in premiums for cattle than for horses. The large attendance upon, and general success of the exhibitions of this Society, is a conclusive argument in favor of fairs without the "agricultural horse trot." The show of farm machines was especially full and varied; among these we recognized many well tried implements, as well as some new ones. The horticultural department was creditable to the locality, though naturally smaller than usually seen at Rochester; the specimens of fruit and flowers on the stands were excellent of their kinds. In the stock departments, the show of stallions was the finest the Society has ever had, and the cattle and sheep exhibit was superior, particularly the latter—not so much in numbers, as for excellence and variety. An interesting feature was the three Grange wagons, which vied with each other in showing the products of the farm, in field, stable, and household. These were great platforms on wheels, about 30 feet long, by 8 feet wide, with standards and shelves erected to hold the fruits and vegetables and other decorations of grasses, grains, etc. One wagon had open cupboards in the sides, showing viands for the farmer's table, and outside of the wheels, under the edge of the platform, were compartments containing a calf, a sheep, pigs, and the several kinds of poultry. As these gaily decorated vehicles moved along the track, they might have been taken for a procession of the olden time in honor of Ceres and Pomona. The success of this Society is largely due to the energetic and disinterested efforts of Secretary Harrison and the other officers, to whose kind attentions as well as those of the editors of the "Husbandman," which so well represents the farmers of that section, are we indebted for much of the pleasure of our visit.

Sundry Humbugs.

If any of our readers have noticed that this column shows a certain amount of repetition, they have discovered that of which we are well aware, but can not readily avoid. It seems to make no difference how plainly we may warn people against a certain scheme. There are many who do not seem to notice what is said, and we are constantly in receipt of letters asking about the very thing that we have exposed in full but a few months before: hence we must either repeat our warning, or appear to disregard a large number of earnest inquirers. Some humbugs are so persistent, and so

often asked about, that we have sometimes thought it might be well if we were to keep certain lines standing in large type; they would read something like this:

FARMERS, BEWARE HOW YOU BECOME AGENTS.
FARMERS, BE CAREFUL WHAT YOU SIGN.
ALL LOTTERIES ARE FRAUDS.
LET ALL WALL STREET SCHEMES ALONE.
BEWARE OF ADJUSTERS OF CLAIMS.
DON'T INVEST IN ANY SECRET SERVICE COMPANY.
IF YOU ARE TOLD THAT YOU HAVE DRAWN AN "ART" PICTURE, DON'T SEND FOR IT.

IF YOU READ THE ADVERTISEMENT OF A DOCTOR, DO NOT ASK US ABOUT HIM, ETC., ETC.

We have given special and minute attention to these very matters again and again—yet, here is a pile of letters asking about these very things, and others, as if they were fresh, and had turned up now for the first time....

Will our readers please understand that we can not make exceptions. For example, we feel sure that there is no more risky business, for even those who understand it, or think they do, than speculating on the stock market, an opinion with which every solid business man will agree. When we warn our readers against

WALL STREET SCHEMES,

we mean *all*, of every kind and stripe. Some who send out circulars have much skill in "the art of putting things," and they show very plainly—on paper—that an investment must pay. Those who receive these circulars are captivated by their plausibility, but, being cautious, they write to ask if we do not except so and so from our general warning. It is some trouble to write a brief negative reply, yet we do this, rather than to appear impolite. It would save the writers, as well as ourselves, both time and trouble, if they would accept, once for all, the statement that we can make *no exceptions*; it is not a question altogether of the persons concerned in it, though some of these are "shaky"—but the nature of the business is such that all engaged in it are looked upon with suspicion. If the cashier or bookkeeper of any business house of high standing, or in any bank, were known to be "dabbling in stocks," he would lose his place. When a "breach of trust," or "defalcation," or other sugar-coated form of robbery takes place, the first question concerning the defaulter is, "Did he operate on the street?"—And it is oftener than otherwise found that this form of gambling is responsible for the ruin of these persons.... The same may be said of

ADVERTISING DOCTORS.

As we would not employ a physician who advertises his cures and sets forth his own ability, we warn others against such, as we regard them unsafe. Yet the number of letters asking if we include this person, or will not except that one, is very large. We wish we could save others and ourselves the trouble of writing, by stating so distinctly and emphatically, that it would suffice for some months, that *we make no exceptions*.... Here is a droll way of exposing a fraud. A person in Tennessee thinks that parties who are advertising some wonderful seeds are injuring the public and also the reputation of the town; he cites the names of several persons who will give evidence that the seed is a fraud, and then

DOES NOT SIGN HIS OWN NAME!

This is a new illustration of the story of the cat and the chestnuts.... The special agents of the P. O. Department are doing much more to protect the public than appears on the surface; their great difficulty is, that the law is so defective that smart swindlers can evade it, and carry on their business while they laugh at the officers; all that they can do in such cases is to expose those rascals which the law will not reach. Mr. B. H. Camp, the special agent at Pittsburg, Pa., sends us an account of the doings of a person calling himself an agent of

M. M. HOWARD & CO.,

who profess to be manufacturers of oils, gasoline, naphtha, axle and car-grease, at Pittsburgh. The chap pretends to take orders for the articles named, at much less than the market rates, and then from this makes a very liberal discount for cash in advance. The swindler has been operating largely in Minnesota, Dakota Terr., and Missouri; when last heard from, he was in Atchison Co., Mo. "M. M. Howard & Co." are like Sairey Gamps' Mrs. Harris—

"THERE AINT NO SUCH PUSSON."

That a swindler should try to operate in this manner, is not strange, but that he should find any one who could be tempted by unusually low prices—the very thing that should excite suspicion—to giving him cash in advance, is certainly surprising. The matter was exposed by the numerous letters for M. M. Howard & Co., received at the Pittsburg P. O.; these proved to be complaints that their "agent" had been paid cash in advance, and the goods had not been received, and are evidence of a lack of business caution that the old woman who keeps a peanut stand on a New York street would not be guilty of. The only remedy in such cases has been administered by this "agent".... Divining rods have been used to find water and mineral veins, and, strange to say, there are people who believe in their efficacy. [N. B.—Do not write us to tell of cases in which the rod has worked. We will not discuss the influence of the moon, the change of wheat into chess, the efficacy of the 7th son of the 7th son, animal magnetism, spiritualism, or divining rods.] But these are outdone by a chap in Massachusetts, who uses the rods to find

VEINS OF ELECTRICITY.

He claims that he can tell where the lightning-rods should be placed to insure protection. Nothing but a want of knowledge of the laws of electricity can induce any to believe in this nonsense. Electricity is a good thing for the medical quacks. "Doct." Campbell,

THE "VITAPATHIC" MAN

of Cincinnati, has got hold of it, and for once electricity

has got the worst of it; he beats Ajax, Bootjaks, or any of those "old ancients," who had a time with lightning. He sells electric machines, and the stuff that they grind out is none of your common kind of lightning; we have heard of "greased lightning," but this beats that. What its different currents will do when applied separately, is remarkable, but "its double compound, vital attentive current," is the current for our currency. Just see what this double, compound, back-action, reciprocating, self-sustaining current will do, when it fairly gets at it. "This current passing through in a proper manner will vitalize all medicines, and all vegetable, animal, and human forms [according to this, the human is not an animal form!]; will cure diseases, restore life, and prevent death." It would be comforting like, if we could honestly stop there, but fairness compels us to give the rest—"even after all other applications of electricity have failed"—"most lame and impotent conclusion."—But what is this electric talk to another treatise by the same "Doctor," which is nothing less than "Introduction to

A LESSON ON OCCULT SCIENCE,

previous to teaching the Full Power." Here we learn that "there is a hidden power in Nature, invincible and sublime." A high old power it is, for besides being variously seen and heard, it is "felt in the balmy air, in the mineral magnet, in the perfuming vegetable, in the electric eel, in the charming serpent, in the magnetic man, and in the fascinating woman." This shows that it is a power worth having, and there are some seven pages more of the same sort; as a power it knocks Corliss' Centennial engine out of sight, for do we not read: "This newly discovered power is stronger than steam, swifter than electricity, and more subtle than magnetism. It is the power of all powers, and the power from which all other powers derive their power." "Occult science"—we should say so! Recollect that this is merely an "introduction, previous to teaching the Full Power." Let us be thankful that the "pow-wow" ends before we get to the "full power.".... After dealing with the occult sciences, after being on familiar terms with electricity and "vitapathy" and things, and having had a glimpse at that powerful "power," it is rather a relief to come from this exalted humbuggery down to the real

OLD FASHIONED QUACK MEDICINE,

that doesn't go poking among the stars and the lightnings, but is of the earth, earthy, one of the real old sort, which shows that the pattern is not lost, but that what has been, shall be, so long as there are people who will believe nonsense, and have dollars to pay for trash. What is a quack medicine without the story of its origin, and what is the use of a story, unless it is both pathetic and absurd? The stuff it is

"LU-CU-PI-A,"

which is not so bad, as a name. The circular is a model in its way, small, but comprehensive—a solid chunk, and so satisfying! The hand of the master is visible in the very first line, which reads, "The King of Terror Baffled!"—He has been that so much, that we should suppose that had become chronic, and his majesty used to it by this time. The next line is "Lu-cu-pi-a." Then follows the portrait of a young lady who—but we anticipate: the graven picture is nothing to the word painting that comes presently. Under the picture is, "Take, and Live."—We admit that this is a little puzzling at the start, whether "Lucenia" is the name of the young lady, and she is to be taken for "better and for worse," or whether Lucenia is to be taken, that we may live and baffle the K. O. T., are points that we look to the history to clear up. The history begins: "In one of the New England States there lives a family"—One of the essential qualities of history is truthfulness, and here we have it. "One member of his family was a lady,"—as often happens in the New England States, but such a lady, "with a sweet, tender face, with dark-glowing eyes (ah!), with coral-tinted lips (oh!), with rosy-tinted cheeks (m!) and amber curls" (whe!) The possessor of these could be no common sort of a lady, and we are not surprised to read that: "She was as graceful as a gazelle, as light hearted as a bird, and as spirited as an antelope"—a sort of menagerie, or great moral show kind of a girl, you see! Notwithstanding all this, the lady "took sick"—that isn't exactly the way it is told in the circular; that says: "But, as frost destroys the fairest flower, so does disease the most perfect woman." Sick she was, "Affliction sore, long time she bore, physicians was in vain"—of course, they always are in these histories, and of course she was given up; then Ada (not an appropriate name, as they couldn't aid her), she went and

"DREAMT A DREAM."

Of course she did it three times running—it always takes three times. To make matters short, in this dream she saw an herb—she never saw it before—Charlie must take her out botanizing, Charlie refuses—girl will go—will die otherwise—Charlie yields—she goes—stream—trees death seemed near—"one wild cry of joy"—"There,

there Charlie, there is Lucipia."—We know the rest—herb gathered—stuff made—Ada took—"and nature lived and coursed through her veins triumphant." *Moral*.—Go thou and do likewise. "Price, \$1.00 per bottle, six bottles, \$5.00." Ada, you are welcomed as a bright star in the constellation in which Old Mother Noble, Eddie Eastman, Thee and Thou Severalbarks, Pilindias Unoka, and the rest are shining lights.

Moths in Furniture—Important.

Taken as a whole, throughout the country, house-keepers suffer more annoyance and destruction of furniture, carpets, and woollen garments by *moths*, than from any other pest. The little red ant is a great nuisance in some localities, but it is not destructive and not very prevalent. Moths are universal, and whole sets of costly upholstered furniture fade away, losing their beauty and substance, even after days, weeks, and months of watching, beating, and picking, with painstaking care. Lately, establishments have been opened in leading cities to kill moths. First it was done by removing the upholstery from the wood and thoroughly *baking* it. More recently liquid preparations have been used. But the necessity of transporting furniture to these establishments, and the large expense, have been serious obstacles. Some parties advertised to sell a moth-killing secret for a certain sum of money.—We are happy in being able to announce to the readers of the *American Agriculturist* an easy, simple process, that we have tried the past season, with what appears to be a complete success. (We mentioned it to a furniture dealer and repairer to-day, and he said he had practised it for some time, and that it was a sort of "trade secret.")

The Process.—A set of furniture that seemed to be alive with the larvae, from the month it came new, and from which hundreds of these pests had been picked, and brushed, was set into a room by itself. Three gallons of benzine were purchased, at 30c. a gallon, retail. Using a small watering pot, with a fine rose sprinkler, the whole upholstery was saturated through and through with the benzine. *Result*: Every moth, larva, and egg, was killed. The benzine dried out in a few hours, and its entire odor disappeared in three or four days. Not the slightest harm happened to the varnish, or wood, or fabrics, or hair stuffing. That was months ago, and not a sign of a moth has since appeared. The carpets were also well sprinkled all round the sides of the rooms with equally good effect. To have known this two years ago, would have been worth at least \$50.00 in the saving to a single set of furniture, and would have saved many days of most annoying labor. If this is not worth, to multitudes of housekeepers, many times the cost of the *American Agriculturist*, we shall be greatly mistaken.—For furs, flannels, indeed all woollen articles containing moths, benzine is most valuable. Put them in a box, sprinkle them with benzine, close the box tightly, and in a day or two the pests will be exterminated, and the benzine will all evaporate on opening.

CAUTION.—Benzine, in fluid or vapor form, is very inflammable; therefore, when using it, have no fire or burning light in the room—not even a match on the floor to be trod on. With this precaution it is safe. With the windows open its odor even will soon disappear.

Some Bee Notes for October.

BY L. C. ROOT, MOHAWK, N. Y.

WINTERING BEES.

I am frequently asked which method of wintering I prefer—out-of-doors, or within doors. My readers of three years past know my preference for in-door wintering, when done under suitable circumstances. If without a properly arranged, dry room, better leave the bees on their summer stands for the winter, as they will ordinarily do much better than when unsuitably packed within doors. General directions for in-door wintering may be found in the *American Agriculturist* for October, 1875. To prepare bees for out-door wintering, each hive should contain at least 25 lbs. of honey at this date. About one-third of the way from the top, and midway between the ends, a $\frac{1}{2}$ -inch hole should be made through each comb, to allow the bees to pass through freely. They often starve in very cold weather, even with plenty of honey in the combs, for the want of these passages; extreme cold preventing them from leaving the cluster, and passing around the edges of the combs to get the honey. The honey-board of each hive should be removed, and a quilt placed over the top of the frames. These quilts should be made of a size to fit the top of the hive, of heavy unbleached muslin, with about half of a roll of cotton batting, and tied closely enough together with stout twine to keep the cotton properly in place. The cap of each hive should be packed closely with chaff or cut straw, and a piece of hurlap tacked on to keep the straw from scattering when it is put in place.

Make a hole in the top edge of the cap, to allow the moisture to escape. If the New Quinby, or any side-boxing hive is used, the space at both sides and top may be thus packed. If hives are not well protected from wind, set posts and make a tight board fence around the apiary. The hive should face the warmest direction; finish the fence on that side later in the season, when the bees fly less freely. Set the posts before the ground is frozen, and finish the fence when desired.

ARTIFICIAL COMB FOUNDATION.

What is it?—and how can it be used successfully?—The base of the cells and a beginning for the walls, is formed by passing sheets of pure beeswax between two rolls. It is one of the leading inventions of the day in our line, and will prove a valuable aid to bee-keepers. I will soon give a full description of the mode of manufacturing, and indicate some of the important ends to be gained by its use.—In consequence of the moderate yield of fall honey, the amount last taken from the hive, of which a record has been kept, was only 10 lbs.

Do bees gather honey from the Ailanthus, and is it poisonous?—I have never lived in sections where this tree was common, and am wholly unfamiliar with it. I do not recall any mention of it by writers on bees.—[Any information on this point will be acceptable.—Eds.]

W. A. Dean, Minn., is referred to the January number, 1876, of the *American Agriculturist*, for directions concerning the New Quinby Hive, and to the October number, 1875, for suggestions about in-door wintering.

Brass Milk Cans—Water Fences.

A young lady reader, who has traveled in many lands, but now lives on a fine farm, loves the country, and is observant of rural things, sends us the following:—I was quite interested in the engraving in the September number representing the "Flemish Milk Wagon," for it brought to mind many little facts in connection with the dairywomen of Holland and Belgium—some of which may be of interest to your readers. The whole "turn-out" is peculiar, as the picture shows, but it does not indicate how much the cans differ from any used in this country. They are all of brass, and shine as if their owners had but just ceased polishing them. A ride in the cars through the rich pasturing districts, presents many new features. As we look on either side for miles over the level country, the gates which are set here and there cause one to wonder how the cattle can be kept in a pasture with only a gate for a boundary. But the fact is, these fields are fenced with a ditch of water some six or eight feet wide, so that a gate on the slight plank bridges which lead from one field to another, is all the protection that is necessary. Much of the land being below the level of the sea at high tide, there is never any scarcity of water with which to make the water fences. As early as four o'clock in the afternoon, women can be seen going out in boats to the pastures through these small canals. The brass milk can stands in the stern of the boat, and is filled from the pail which the woman uses when milking the cows. There are scarcely any trees in these pastures, which, however, is not such a lack in that country as we should consider it here, as the climate is mild and moist on account of the close proximity of the ocean. [In traveling through Holland, we noticed that in many places there were no gates even. The short bridges alluded to by our correspondent were arranged to slide off, or perhaps more frequently to raise up. So, to "close the gate," they simply elevated one end of the bridge, sometimes two or three feet, and sometimes they stood perpendicular. Some were held up by a cord or rope attached to a stake; others were supported erect by an upright post that lay upon the ground when the bridge stood on end. On the west coast of Holland, subject to cold winds from the ocean, most of the cows in the fields, even in July, were covered with a sort of blanket jacket, extending from the shoulders or neck to the flanks. Many of these were in variegated colors, and were quite ornamental.—Ed.]

Tell Us About Your Wheat.

The wheat questions in the September number (page 334), have called forth many responses, which contain so much of interest, and we consider the subject of so great importance, that we are desirous of obtaining data from as many wheat growers as possible, in order that the results may be of the greatest benefit to our readers. If every wheat-growing reader of the *American Agriculturist* would reply to these questions, we could present such an array of facts that each one would be many times repaid for his trouble, in being able to compare his own experience with that of hundreds of others from widely scattered localities. All of

the questions may easily be answered on a postal card by writing the replies opposite the respective numbers, as in the following transcript of one of the replies received:

(1.) Don't sow any.—(2.) Hard Scotch Fife.—(3.) Black loam, clay subsoil.—(4.) Burnt straw.—(5.) Scatter straw when we thrash.—(6.) $1\frac{1}{2}$ bushels.—(7.) 15 bushels on the average.—(8.) Think not.—(9.) Never.—(10.) April, or as soon as possible in spring.—(11.) 75 cents to \$1. (Signed,) HENRY ARMSTRONG, LORISTON P. O., CHIPPEWA Co., Minn., western part of State, on St. Paul & P. R. R. Send on the postal cards, the more the better.

Steam Power for Farm Use.

On many farms, steam as a motive power is now considered indispensable, and its rapidly increasing use for farm purposes is a striking sign of agricultural progress. Many large farms of the West

would be almost as much at fault without steam, as a back country saw-mill without water. The multiplicity of uses to which steam power can be applied on a farm, is hardly appreciated, save by those who have had experience. The proper "agricultural engine" is mounted on wheels, that it may be moved from one part of the farm to another, and the greater number of purposes to which it may be applied, the more valuable it will be. Such an engine may be used for running a threshing machine

Fig. 1.—ENGINE IN POSITION.

in the field or at the barn, or a portable saw-mill in the woods, for turning a grist-mill, or for ginning cotton. When placed in position at the barn, its power may be utilized for baling hay, running a hay fork, cutting fodder, sawing wood, pumping water, winnowing grain, shelling corn, etc.; while its steam may be utilized, if desired, for steaming fodder, or cooking food for swine. By connection with the dairy, it may run the churn, and the steam warm the milk room, or even be used for heating milk. A year ago we illustrated several excellent engines used for these purposes; the one now presented is a portable machine, made at the Pennsylvania Agricultural Works, York, Pa. It differs from some others in its vertical tubular

Fig. 2.—ON WHEELS READY FOR MOVING.

boiler; figure 1 represents it in position for use, and figure 2 shows the engine mounted on wheels, for transportation. The wheels shown in figure 1 are on an axle made fast to the boiler, and are useful in placing it in position; any farm truck may be used for forward wheels. In common with

other wares of the manufacturers, this engine has a good reputation among those who have used it; is substantial, compact, economical of fuel, easy running, and sold at a reasonable price. It is claimed for this vertical engine, that it is much cheaper than a mounted horizontal engine of the same power, while nearly equal in essential particulars.

Our Country Financially.

Important and Interesting Figures.

At the Minnesota State Fair at St. Paul, the President of the United States was present on Sept. 5th, and addressed an immense throng of visitors, dwelling mainly upon the material interests of our country. We epitomize from the address a few figures, which show the wonderful recuperation that has taken place even during these past five years of financial distress and enforced economy. These figures refer to the operations of the General Government. During the same time, by the economy in the expenses of individuals and families, in living, clothing, etc., the reduction of private debts, and the accumulations in savings' banks, in Government and other bonds now held by our people instead of by foreigners, there has been going on a very great addition to the real wealth of the whole country, which will be shown in its magnitude by the census of 1880. But to the figures:

	Aug. 1865.	Aug. 1878.
Total Interest bearing debt of the U. S. Government..	\$2,381,530,295	\$1,809,677,900
Decrease.....		\$571,852,395.
Annual interest paid.....	150,977,698	95,181,007
Annual Saving.....		\$55,796,691.

(This annual saving, if put on interest each year, as a sinking fund, would in 24 years pay off the National Debt.)

Total taxes paid in the form of Customs and Internal Revenue taxes:
In 1865.....\$488,273,465.—In 1878.....\$240,753,305.
Reduction.....\$247,521,160.—(more than half.)

Total expenditures, including pensions and interest:
1867: \$357,542,675; 1873: \$290,345,245; 1878: 236,964,327.
Reduct'n '67-73, \$120,578,348—Reduct'n '73-8, \$53,350,918.

Total Paper Currency Circulation, including Greenbacks, National Bank notes, and Fractional Currency:
In 1865.....\$735,719,266.—In 1873—\$687,743,169.
Value in gold.....509,999,595.....684,000,040.
Greenbacks worth, about.....694 cents, gold.....994 cents

EXPORTS AND IMPORTS.

The excess of Imports over Exports, from 1863 to 1873, ranged from \$39,000,000 to \$182,000,000. On the contrary, during the past three years, ending July 1, the exports have exceeded the imports as follows:

1876, \$79,648,481; 1877, \$151,152,091; 1878, \$257,832,667.

Total excess of exports over imports, (not including gold and silver, of which we have sent abroad large amounts produced here), for three years: \$488,628,242.

The exports of Agricultural products for the year ending July 1, 1868, were \$319,904,531.—For the year ending July 1, 1878, they were \$592,478,813. Difference between now and then, \$273,474,282.

Of Farm Products, and Petroleum, the exports for two separate years, ten years apart, are interesting:

Year ending June 30,	1868	1878
Breadstuffs, (grain, flour, etc.)...	\$68,990,937	\$181,774,507
Provisions, (meat, but'r, ch'e, etc)	30,278,253	123,549,986
Petroleum.....	21,810,676	46,574,976
Cotton, manufactured.....	4,871,054	11,435,628
Leather.....	1,414,372	8,077,659
Live Animals.....	733,395	5,844,653
Oil Cake.....	2,913,448	5,095,163
Agricultural Implements.....	673,381	2,575,193
Fruit.....	406,512	1,376,969

The balance of trade against us from 1869 to 1873, was over \$110,000,000 a year. During the past three years, it has been in our favor over \$160,000,000 a year, and in the past year, over \$257,000,000, exclusive of specie.

House Your Poultry Early.

BY I. K. FELCH.

The change from summer to fall, with its warm days and cold nights, has its influence upon poultry. There is a distemper called "snuffles" that every chick has as it matures into a cockerel or pullet, though it is often unnoticed, and for want of treatment results in roup, when it becomes contagious, and disaster and death to the flock follows. If the young chicks are taught to occupy the fowl houses before October, no very serious trouble results.

Symptoms of the Distemper.—Listlessness; face and comb quite red, and a puff or fullness of the face under the eye; the second day a white froth in the corner of the eye; a decided loss of appetite.

Treatment.—If taken in hand before the appearance of the froth in the eye, it will usually only be necessary to wash the head and beak clean, and blow down through the nose into the throat, either with the mouth, or by means of a rubber nipple, thus clearing the tear tube; and bathe the head and wash the throat with a solution of carbolic acid—one part acid to ten parts water. The birds should be kept in a quiet place and allowed nothing but water. The third day they will be quite well.

In aggravated cases when the eyes and face are much swollen, the head and throat should be thoroughly steamed by the use of a large sponge and hot water. The tear tube should be cleared (as above), a desert-spoonful of castor oil given, and bathing the face and throat with the carbolic acid solution, continued at short intervals.

This distemper may be called a cold, or the incipient stages of roup. In our opinion it is no more roup than a cold is measles. There is no offensive smell to the breath as in roup, but if neglected it will induce that disease. The breeder has the choice of adopting the adage, "A stitch in time saves nine," or by neglecting it, have that scourge of a poultry house, "roup," to contend with. Be sure your fowls are in winter quarters before the frosty nights of October, and this, with other drawbacks to success, will be avoided.

Talks on Farm Crops.—No. 20.

By the Author of "Walks and Talks on the Farm,"
"Harris on the Pig," etc.

There is much talk and not a little enthusiasm in regard to the use of artificial manures for wheat. "You can see to the very drill how far the phosphates were sown," is an oft reiterated remark. "I put a mark on the fence," said one of my neighbors, "but there was no need of that. A blind man could see how far the manure went."

"Yes," said the Deacon, "and they say clover shows just as plainly the effects of the phosphates."

"You mean," said I, "that when wheat is dressed with superphosphate and seeded down with clover and timothy, the phosphates not only benefit the wheat, but give a better crop of clover afterwards. This is precisely what I should expect. And if the clover is plowed under, or pastured, or if made into hay, and the manure saved and applied, artificial fertilizers will greatly enhance the permanent value and productiveness of the farm."

The Deacon is a new convert to the use of artificial manures, and is acting as agent for their sale. Possibly the commission has something to do with his conversion. He was walking over my field of mangels yesterday. We have been very short of men, and have had great difficulty in keeping the crops clean. Still, my mangels never looked better. When we had walked about half across of the lot, the Deacon stopped and wanted to know if I had been using any phosphates. "Why do you ask?" said I.—"Up to this row," he replied, "the mangels are not nearly so good as on the rest of the field. On this portion there are many vacancies, and I see you have set out cabbages to fill up the gaps."

"Yes," said I, "we set out over 20,000 cabbage plants, and I think 99 per cent of them lived and have done well. It is not nearly so much work as one would suppose, and the ewes and lambs next spring will be very grateful for them."

"You had better have drilled in phosphates on the whole lot," said the Deacon, "and thus saved the necessity for cabbages. Up to this row you have seven acres of mangels that completely cover the ground, and not a thousand cabbages on the lot, while on the remaining seven acres, the mangels, while perhaps as large, are not so even and regular. You did not sow any phosphates on this half?"

"No," said I, "there were no phosphates sown here, nor on the other half. There is no difference in the land or in the seed or manure. There is only one reason for the difference. The land was a

clover sod last year, which was a very poor catch. We plowed up the north half and sowed corn-fodder, pasturing the south side and plowing it early in the fall. This spring the whole field was plowed, and 8 or 10 tons per acre of well rotted manure spread on the furrows. It was then harrowed with a Thomas' smoothing harrow to break up the lumps of manure; and afterwards with a heavy three-horse harrow to work in the manure. It was then plowed again, rolled, and harrowed. And the heavier portions were cultivated with a two-horse cultivator, from which we took out every other tooth and then let it run as deep as two good horses could pull it. This mixed the manure still more completely with the soil and brought more lumps of hard soil to the surface. These were again rolled and harrowed, and the land, as far we had gone, was ready for the seed. We marked out the land, north and south, into rows of 2 feet 5 inches apart, drilled in the seed, and followed with a two-horse roller. When we had sown half the field, I concluded that seven acres was about as much as we should be able to hoe before the plants got too big. Mangels are sometimes slow in coming up; not so the weeds. As soon as we can distinguish the rows, we go through with a horse hoe, I follow with the hand hoes, singling out the plants a foot or fifteen inches apart, and at the same time, cutting up all the weeds. It is very important that this work should be done promptly. A few days delay not only checks the mangel plants, but adds greatly to the labor. Weeds are like fire. It is an easy matter to put out a fire just as it starts, and it is much easier to keep the weeds down just as they are starting to grow, than after they get possession of the soil."

"We all know that," said the Deacon.—"True," said I, "but we are very apt to forget it every spring. I have been caught more than once, and a singed cat dreads the fire." I did not want to put in all my mangels at the same time, because I knew we had not force enough to hoe them all at once. After we had drilled in the seven acres, I thought we had better wait a few days before sowing the remainder of the piece, and as we had time I concluded to give the land an extra plowing. And that is the only reason why the mangels are so much better on this half of the lot, than on the other half. That extra plowing was worth \$10 or \$15 an acre."

If I had to commence farming again, I would use the plow more freely. A German neighbor, whom I have alluded to, as one of the best and most energetic, and successful farmers in the town, planted eight or ten acres of early potatoes last spring. Just as they were coming up we had a severe frost, and the plants were more or less injured. Still he cultivated and hoed them and they finally grew vigorously, and looked quite promising. But for some reason, he neglected to "green" them. I presume he was busy with other matters, and so did not notice the bugs, and not a green leaf was spared. Then the weeds took full possession. It was a sorry sight; I could hardly understand what so good a farmer was thinking about. By and by, however, I noticed a wagon in the lot, and half a dozen men and boys at work among the weeds. They were digging the potatoes, and drawing them to market. It looked like slovenly work. But the next time I drove past, not a weed was to be seen. A good plow, with a jointer, had buried them. The change was wonderful. The field from being a picture of desolation, had been suddenly converted into a model wheat-fallow. It must have required some nerve to have abandoned the crop of potatoes, but it was undoubtedly the wisest course, and the quick use of the plow, enabled our friend to win a victory, out of a seeming defeat. It put the weeds under before they went to seed, and converted them into green manure.

"I think I know what you are about to say," said the Doctor. "You want to recommend farmers to plow their land in the fall as soon as the crop is off. This would certainly improve the appearance of the country. And, on the whole, it is safe advice. But what of the fact, that where no plants are growing, the water which passes through the soil carries off more or less nitric acid."

"I will not discuss this matter now," said I. "It

has an important bearing on some of our farm practices, but I think we need not hesitate to plow land in the fall and otherwise prepare it for spring sowing. I feel sure that it would have been five hundred dollars in my pocket if I had plowed all my land last fall that I was going to sow to barley in the spring. I did plow some of it, and there I had a capital crop. But on two other fields, that were not plowed until spring, the barley was seriously injured by the Hessian fly. If it had been sown a week or ten days earlier, I should have had a good crop—and this year good barley will bring a very high price. And so I feel quite sure that I am safe in advising farmers generally to plow and keep plowing during our splendid autumn weather.

"Many farmers," said the Deacon, "are talking of abandoning barley. This is the first time the Hessian fly has seriously injured it in this section."

"True," said I, "but so far as I have observed it was the poor, late sown crops that were injured, and this fact furnishes another argument in favor of fall plowing and good farming. We should either give up trying to raise barley, or make up our minds to drain our land, work it properly, and make it richer. Barley must have a good, dry, warm, mellow soil. And then we should sow early and drill in some good artificial manure with the seed. Taking one year with another, commercial fertilizers will pay better on barley than on any other ordinary farm crop, and now is the time to get the land ready for the crop. Many crops this year were hardly worth thrashing. Occasionally a good field gave 50 bushels per acre, and just think what a difference this makes in the profit. Figure it out for yourself. Good cultivation does not alone make the difference. But without good tillage, we certainly can not have a good crop of barley."

"You would not plow sod-land for barley in the fall," said the Deacon.—"Perhaps not," said I, "but I would plow all the stubble land; we usually sow barley after corn, potatoes, corn-fodder, beans, roots, etc. If need be, I plow between the stooks of corn before they are husked. We finish the plowing after the crop is husked and the fodder drawn in. The Deacon objects to it because it makes too many dead furrows, but these can be plowed back again in the spring, and by cultivating across the lands the field is made level if desired."

Breaking and Training Colts.

BY E. N. JENNINGS.

The word "breaking" appears in the heading, but it shall be used no further in this connection. Breaking is a brutal word and a brutal practice, and an unnecessary one. *Gentling* is a much better term, and describes the only proper practice. The trainer should be on friendly terms with the young animal so soon as he is approachable, and the training should begin when it is a month old. On first going near the colt, do it quietly and gently; don't frighten him, but be deliberate in voice, touch, and motion. Make every movement on this first acquaintance very cautiously, not to excite his fears. Gain his confidence now, and you will keep it, unless abused afterwards; having his confidence, you can do about as you will with the child-horse. The first motion should be to extend the hand in front of, and as near as may be without frightening him. Then gradually draw nearer, carry-

ing neither whip nor stick. Let him first smell your hand, before touching any part of him. The trainer should govern his actions by those of the colt. If he is inclined to kick, be very careful, and do not let him jump upon or strike you with his fore-feet. A colt, in common with most domestic animals, seems to judge of a would-be-acquaintance or friend by both sight and smell, and fears that which he can not see. The best place to first touch him is on the face. This being permitted, gently caress and fondle him for a few moments, and the first lesson is learned.

Haltering and Leading.

When first approaching to tie him, carry the halter on the left shoulder rather than in the hand, so that both hands and arms may be entirely free. Advance to his near side, as the more convenient, for he is thus less liable to kick. Caress him, and when he becomes calm, let the halter slide down quietly into the left hand. Then very gently, but quickly and surely, slip it over his nose, and with the right hand draw it over his head and fasten it in position. It is important that this first attempt to halter be successful, as otherwise it will afterwards be very difficult to do at all. Having escaped once, more or less frightened, he will shun a second effort to put him in leading strings.

Fig. 1.—A COLT IN THE "MOUTHING TRAPS."

During the first effort to lead a colt (and many horses always), do not look at him, but turn and walk away deliberately, giving a gentle hint with the halter that you would have him follow. If he undertakes to pull at the halter, do not oppose, but ease up as he pulls. "Play him," as a skillful angler does a trout. If you look in his face, or pull strongly at the halter, he will not start. Halt the colt frequently, at first, and pat him; if he does right, be sure to let him know it. A colt appreciates praise, as well as a human being. "Pats are better than taps." If disobedient, don't punish him or pat him, but let him know what praise means. After the colt is halter-broken let him grow, handling and haltering him frequently. Experience proves that a month old is not too young to commence training. At a year old a light harness may be put on, omitting the bridle, or at least the bit, until a year later. There should be no loose straps dangling at the harness first worn, though afterwards allowed that he may get used to them.

Bridling and Biting.

At two years old, the colt that is well broken to the halter, and will permit easy handling, may be bridled and fitted. If he has not been trained to the halter until near this age, a week or ten days of thorough work with the halter, and in leading him by it, is necessary before biting. The illustration, figure 1, represents an easy and convenient means of getting the animal accustomed to the bit, and of toughening the mouth. The apparatus con-

sists of a simple bridle with an ordinary mouthing bit (a snaffle), with reins attached, as shown. On the crupper-strap is a spiral spring in a sheet-iron tube. Through an eye at the rear end of the spring is passed what corresponds to the check-rein. The lower reins, attached to the girth, prevent raising the head too high; the spring eases the pressure from the upper rein on the mouth, and the colt does the toughening himself by working his head up and down. He is backed into a stall, and tied to "pillar reins" made fast to the posts, as shown in figure 2. This keeps his head straight, yet he is not uncomfortable, and the whole arrangement makes him acquainted with the bit, and he learns to respect it. Teach him thus for an hour or so daily, taking care not to tire him, gradually lengthening the time to two or three hours. Each day after this exercise the colt should be taught to back—gently, as it is hard for him to understand what is wanted, and backing is, indeed, about the most difficult thing to teach the young horse. Thorough biting, before harnessing, is desirable, and indeed essential to proper training, but ten days or so of this practice will usually fit the colt for

The First Lesson in Driving.

The young horse should be driven a few times in the harness—the trainer in front—and taught to turn to the right and left, to rein back, etc., before attaching to a wagon; use long reins, and possibly an assistant may be useful to show him what the reining means. Always use a light vehicle at first, as many horses are made haulky by hitching to a heavy wagon at this time. A "kicking-strap" should be fastened over his rump from one shaft to another to prevent his heels hitting the wagon. If a colt hits nothing when he kicks, he will soon stop kicking. In starting off, some one should lead the colt a few hundred yards, to encourage him, and he should be patted when let go. When training, remember that "a light hand makes a light mouth, and a pleasant driving-horse." The

well known important rule of practice, to start a horse by word of mouth, rather than by a touch of the whip, applies especially to the training period.

Saddling

should not generally be attempted until the colt is three years old, though it is sometimes done without injury at two years. An assistant should hold the horse at the first saddling. Let him see and smell the saddle. In placing it upon his back, turn the girths and stirrups over the top, and in fastening the girths, do not let them swing about lest they frighten him; buckle them loosely, for if too tight they are liable to get burst. Let the colt become used to the saddle before riding him. After two or three days, the stirrups may swing loosely in order that he may get accustomed to having his sides touched. Many of these suggestions may seem simple and useless to the ordinary horse-breaker, and to others; but experience teaches that attention to them often makes all the difference between a well trained and a badly broken horse.

Fig. 2.—SHOWING THE "PILLAR REINS."

A Model Carriage-horse.

We seldom find a more perfect horse for carriage and saddle than the one our artist and engravers have faithfully portrayed in the illustration presented herewith. His name is Dom Pedro, he is a gelding, owned by Mr. Lawson Valentine, of Orange Co., N. Y. He was bred in Schuyler County, his sire being a Morgan from Vermont; his dam was by Texan Jim—quite a famous horse that stood in Seneca County for many years, and sired a large number of fine carriage-horses. This "Texan Jim" is said to have been a wild horse captured on the plains of the Lone Star State. Dom Pedro, however, is strongly of the Morgan type. He is well

himself to that class of farm and draught horses represented by the Normans, Clydesdales, etc. But the majority of the best carriage horses come from the small farms where one or two colts are foaled each year, or from an accident on the part of the trotting-horse breeder. If breeders would turn their attention to the production of such horses as Dom Pedro, their profits would be quite as large as now, as there is an unlimited demand for them; and their work would be more beneficial to the public at large, both pecuniarily and morally. Gentlemen often spend days and weeks in search of carriage horses, and when they do find one combining the desirable qualities of form, weight, spirit, speed, endurance, and good training, are willing to pay a corresponding price for him. Only those

of skill in the use of the sulphuric acid employed to "cut" the bones with. Bones are composed of phosphate and some carbonate of lime, and organic matter, the latter containing the valuable ingredient, nitrogen. The phosphate of lime of bones consists mostly of one part of phosphoric acid united with three parts of lime,* which, being insoluble in water, is not available to plants. But this phosphoric acid is the most valuable constituent of bones, and to make it available in the cheapest manner is the one problem of both manufacturer and farmer. The manufacturer does this by treating 100 lbs. of finely crushed bones with about 50 lbs. of sulphuric acid. This acid combines chemically with a portion of the lime of the phosphate, leaving the phosphoric acid united in the

DOM PEDRO.—A GOOD SPECIMEN OF A CARRIAGE-HORSE.

proportioned and finely moulded, full of vigor and energy, yet so docile that ladies handle him easily. He seems almost conscious of his beauty, and when turned out loose in field or paddock, he will curvet and prance, and dash over the green sod, in view of spectators, with much of the grace and spirit of his free ancestors of the plains. His head is fine, and his face shows a high degree of intelligence; the eye is bright and spirited, but gentle. He is quick to respond to the call of his master or mistress, in saddle or harness, or when loosed from the halter.

In color he is a bright chestnut; he stands about 15½ hands high, and weighs 1,050 pounds. His body is well rounded in barrel, rump, and neck; his legs are fine, hard, and muscular. In "action" he is exceptional, and "steps like a prince of the blood." He is a superior roadster, though not a trotter, nor is desired to be such. "To be king among carriage and saddle horses, is greater than to be second on the turf."

The raising of carriage horses is too little practised among breeders, their knowledge and interest being more centered in the production of trotters; though one is found now and then who devotes

who have engaged in this horse hunting, can understand the scarcity of good horses. Were the demand appreciated, there certainly would be a better supply.

Home-made Fertilizers.

The most successful farmer is the one who avails himself of every means to enrich his land from home resources, and allows nothing to go to waste which can be utilized for plant-food. If success comes when refuse material is only partially utilized, how much greater the success when this refuse is so manipulated as to secure all of its fertilizing properties in the most available form, and in a condition best suited to the needs of the crop?

Fertilizers from Bones

are those most frequently attempted by farmers, because of their known value for the majority of crops. Well made commercial superphosphates are found to be very efficient fertilizers, and farmers often seek to imitate them, but with indifferent success, always with inconvenience, and often with injury to person or implement, on account of lack

proportion of one part, to one and two parts of lime,† either of which is available to plants. Now it is found that when bones—not treated with acid—are reduced to a fine powder, they are more available as plant-food than when in coarse lumps; and the finer they are, the better and quicker acting fertilizer they make. If a fertilizer, nearly or quite as valuable as the commercial article, can be made at home, without acid, it is certainly desirable.

How Shall it be Done?

By putting bones, coarse or fine, even whole ones, into a compost heap of stable-manure or muck, the decomposing action of the organic matter will work upon the bones, and in three to six months' time thoroughly reduce them to a fine mechanical condition. The acids set free in the decomposition also act in a manner similar to the sulphuric acid of the manufacturer—uniting with a portion of the lime, and thus bringing the phosphoric acid into a more available form, as well as converting the organic portion of the bone—or,

* Tri-basic phosphate of lime.

† Mono-basic and bi-basic phosphate.

rather, its nitrogen—into the proper condition for plant-food. The operation, as successfully practised by the writer, and others, is to take all the bones obtainable, or it is thought best to use—either whole or ground—and place them in layers with three or four times as much stable-manure—first a layer of manure, then one of bone, and so on. The whole is thoroughly mixed by shoveling, covered with a few inches of fine loam to absorb any ammonia that may possibly be set free, and moistened occasionally with water, or best with liquid manure. In from six weeks to six months an excellent fertilizer will result, similar in all essential particulars to commercial superphosphate, with the addition of the dung, and may be used with like effect, and on the same crops—reckoning, of course, on the quantity of bone put into the combination, not on the amount of the compost itself. The time occupied by the operation depends on the fineness of the material used—ranging from “ground bone,” to a whole skeleton of an ox or horse—and on the care taken in its management. The heap should be forked over often enough to prevent undue heating or “fire-fanging,” while the moistening keeps up a rapid decomposition. The cost of this will be the price paid for the bones, if anything, added to the labor—in all, not more than one-half to two-thirds the cost of the purchased superphosphates. And in the home-made product we have the surety of a pure article. Of course this method can not replace entirely the use of the phosphate of the market; but for the saving of the waste bones, dead animals, etc., about the farm, is worthy of trial by the economical husbandman. As it is usually desirable to have this bone compost in a condition to apply to the land as soon as possible, if the bones can be cheaply broken into small pieces, they are to be preferred to whole ones. Many farmers know how difficult a job it is by the ordinary means of mall and stone. The device illustrated herewith is

CONTRIVANCE FOR POUNDING BONES.

suggested as an easy means for pounding up bones. A large flat stone is sunk about a foot or so in the ground, and a half-barrel, with the head knocked out, inverted upon it, and the earth is then solidly packed around the barrel. This will serve as a mortar; the pestle may be any convenient heavy piece of iron, fastened to a stout rod, the upper end of which is to be attached by a strap to a spring-pole, which is secured to two posts at the proper height. By this simple contrivance, which is a modification of the druggist's mortar and pestle, the labor is greatly facilitated, as the spring helps to lift the weight, and is but a slight obstruction to its descent. This will serve to effectually smash up the bones, and prevent waste from the pieces flying about.

The Market for Wheat.—Though hard on the people of that country, the great famine in China has created a large demand for the cereals of the other Pacific Coast States. Owing to the drouth of last year, the area in wheat is less than usual this season in that section, but the product brings a better price by reason of this demand from across the Pacific. Steamers from San Francisco

are carrying considerable freight of flour and wheat to supply the Asiatic demand. The increased acreage of wheat in Great Britain and Ireland is estimated at over fifty thousand acres; but to supply the home demand there, about thirteen million quarters (104,000,000 bushels) will be needed from abroad. In France the crop is somewhat below the average, so that country will this year be a buyer instead of seller. Altogether, the prospects of a market for the American wheat are excellent, if prices are not held so high as to prevent free exports. The aggregate crop here is so large that moderate prices only can be looked for.

Among the Farmers.—No. 33.

BY ONE OF THEM.

Butter.

The cheaper butter becomes, the more interest people seem to take in its production. Nevertheless, butter is not really cheaper than in war time when prices were nominally the highest. It ranged then from 38 to 50 cts. at retail, and now it is sold in New York at 20 to 30 cts. Then greenbacks were worth 50 cents on the dollar, now they are at par. The West is vying with the best Eastern dairies in the quality of its butter, while the quantity produced is annually increasing with great rapidity.

Churning and Working Butter.

Do we make butter or—what? If the *grain* is lost and the microscope shows chiefly a mass of ruins of butter globules, caused by too long churning, churning at too high a temperature, or working unskilfully, rubbing and smearing it, instead of simply *pressing* out the buttermilk, then surely we make grease and not butter, though it come from milk and cream of the purest kind, and be treated in the most cleanly manner. My theory of the action of churning, is, that it is not the breaking of all these cells, thus allowing their fatty contents to run together, that makes butter of the highest quality, but when best done it results in the breaking of just few enough of the globules for the outsides of the others to become smeared with their contents and so adhere to each other. Butter thus produced may be washed without loss of flavor, worked, salted, and put into form without becoming greasy. Waxiness is not altogether dependent upon butter globules being unbroken, for at a low temperature almost any butter may be said to be waxy; but the *granular* character which the best butter possesses is never observed in greasy butter; the “*grain*” is gone.

Color remains essentially unchanged in the unbroken butter globules; the delicate flavor, which, by the way, multitudes of butter consumers have never perceived, is here, so to speak, confined; that is, it is confined to the cells—I cannot say *in* them, for mashed and broken butter globules lose odor and flavor, and color too, on short exposure to the air or water. And every butter maker knows that the *good* butter gains color by standing a few hours after being worked. The air absorbed during the working gradually influences the entire mass.

Changes of Flavor.

It would be interesting to know whether this action of the air has any effect in improving the flavor of the best butter. The flavor certainly changes from hour to hour after churning, with considerable rapidity. Some people are exceedingly fond of the flavor of very recently churned butter; others prefer it twenty-four hours old, and it is fair to suppose that after this time if it does not improve; good butter does not deteriorate for at least ten days. A change, however, gradually comes over the best of butter. At first it loses that peculiar creamy flavor, and is even said to grow sweeter; then there is a sort of reminder of clover and sweet vernal grass; of “fresh fields and pastures new,” called the nutty flavor, which gradually passes away. So good butter is *best* when not far removed in point of time from the churn and the pastures.

Tastes differ. I have a friend bred in one of the best dairy districts of Massachusetts, who prefers firkin butter packed in autumn, or even the previous June, to the best May butter he can be served

with within a week from the churning. And another, I almost blush to say it—yet he is a most estimable gentleman and a recognized scientific authority, who, if he has not changed since we were at school together, actually prefers his butter decidedly “strong.” Well, I don't know that I can say anything against the peculiarity of his taste, for after a very short schooling I cultivated a liking for some of the most powerfully odorous Dutch and German cheeses, so as to take great satisfaction in eating that which was promptly nauseating at first acquaintance. I am led to this discussion, to enforce the fact that it is for us butter producers to take all possible pains to cultivate a taste and fashion among consumers of butter which shall neither be satisfied with the article manufactured from beef suet, salted, flavored, and dyed to suit the market, nor with common butter of the stores.

Halter-breaking Heifers.

An occurrence which fell forcibly under my observation a few days ago, enforces the importance of handling young stock more or less, almost constantly. A gentleman bought a yearling and sent two “smart” boys with a dog or two for her. She had never been handled, yet was delivered to the boys, who were lads of 16, or thereabouts, led by a rope upon her horns. It was not long, between the worrying of the boys and fear of the dogs, before she lost her peace of mind. Taking the road at a speed of her own, and not minding much the boy at the end of the rope, she went gaily on her way. Such a heifer knows that a dash through a clump of bushes will free her from flies, and she found it an equally effective way to get rid of boys. So left to herself and her own wild will, she came to grief, and was found after a day or two back in the wood pasture, with one horn off, hipped, cut, bitten, and bruised, and wild as a deer. The ruin of a fair animal like this is no small matter; somebody has to bear the loss, and that clearly can not in this case fall where it ought—that is, about three-quarters on the breeder and the rest on the buyer, who could send such a pack of boys and dogs to bring his purchase home.—No animal is more easily tamed than a heifer, and none will sooner reward kindness with affectionate confidence, not only towards her handler, but towards all mankind.

Familiarity of Cattle with Children.

We do not hear of all the children who are injured or killed by vicious cattle. It is a terrible thing to see a young half-broken cow chase a child out of a pasture if the escape be a narrow one; but how infinitely worse it is to have her overtake the little one and toss or gore it. The child's fright often causes it to faint, which is a great relief and often a matter of safety, for the animal quickly sees that there is no danger to her from such an one. Cows and young stock in this country are usually familiar with men-folks, while they see little of women and children—hence they fear and defend themselves from them just as they would from dogs. In the same way many a horse has been fatally gored by a cow or heifer, simply because the latter had never been made familiar with horses. My horses are grazed more or less in the calf pasture, and so the calves know the horses, old and young, and as cows, are perfectly quiet with them. If this is important, and I think it is, it is ten times more important that the heifers should grow up in familiarity with women and children—be driven and fed by them more or less, and at calving time see that children may play with their calves without any harm coming to them. If heifers pass their first calving without getting frightened and distrustful of men and of children, they will always thereafter be quiet and tractable. The practice of turning heifers and young stock out in the mountain pastures for the summer, interferes with this training, but it should be followed all the more diligently in the winter. We can sell our trained heifers and deliver them on board cars, steamboat, or anywhere else, with whole skins, good horns, and unruffled tempers, with a very little attention to their education at the proper time.

Tethering Horses and Cows.

It is a good while since I have made any modification in my ways of tethering. Horses are tethered

by either foreleg—never by the head. The best tether is a rather stout chain (not less than $\frac{1}{2}$ -inch iron with 2-inch links) with rings and swivels at each end. This is most conveniently attached to the leg by a well-fitting fetter. I had sets of fetters sometime ago which were excellent, but they became rusty and were finally beaten and broken. Since then I have used an inch and a quarter to an inch and a half strap, passed twice around above the pastern joint, each time through the ring, and buckled just so snug that it will not slip over the joint, and yet so loose that it will slip around the leg. The tethered animal must be led to the end of the tether before it is set free, and then watched a little so that it shall not start off with a rush in the opposite direction and be brought up too suddenly. I have never had any difficulty with horses—they seem to comprehend the situation at once. Cows are tethered in precisely the same way, but by the hind leg. They will sometimes kick excitedly for a while, but no harm ever comes of it. To avoid this I usually attach the chain, and then lead the cow some distance to get her accustomed to the burden upon her leg, and to let her see that it will do her no harm.

Standard Fowls.

BY I. K. FELCH.

The numerous poultry papers teem with advertisements of "Standard Fowls." How is this term to be understood? We have seen the practice condemned on the ground that no bird is a standard fowl unless in every particular it fills the description of the Standard of Excellence. In that sense there are no standard birds, for none are perfect. But it is unfair to take this extreme view. The writer holds the opinion that one has the right to use the term "standard fowls" if it be true that the stock he offers will scale 85 points or more; for the standard places the minimum number of points a first prize bird shall scale at that figure. Those opposing the use of the term claim that amateurs are misled by it. But ought they to be so misled? We think not; for there has not as yet been reported a perfect specimen. Although there has been, through the facetiousness of a judge, one or two specimens scaled close up to 100, yet it has never been our lot to see one better than 96 points, unless the excess was the result of credited weight. So long as not one bird in five thousand scales 95 points, we deem the term a legitimate one when used to designate fowls acknowledged as first-class.

Horses with and without Shoes.

The European papers are discussing the question of shoes or no shoes for horses, with the argument apparently in favor of those who advocate barefeet. The fact is cited that wild horses, necessarily unshod, always have fine feet, as also do the horses of most savage and barbarous peoples, even in

Fig. 1.—HOOF FITTED FOR CHARLIER SHOE.

rocky and mountainous countries. Against the assertion that the hard, macadamized, and paved roads of cities and towns demand a metallic shoe, is opposed the fact that in Porto Rico, at least up to 1840, no shoes whatever were used, yet the streets are paved and macadamized. The races of St. John even, where horses go a mile in less than 4 minutes, are run on the stone paved streets of the town of San Juan; and a writer in the "Live Stock Journal," (Eng.), who spent many years in that island, says that he almost never saw a sore-footed horse there. But the celebrated veterinarian, Mr.

Fleming, comes out strongly in the "Veterinary Journal" against bare feet, claiming that their moist climate and hard roads demand a metallic protection to the hoof, as proved by experience.

Fig. 2. CHARLIER SHOE.

At any rate the new-old idea is attracting attention, and some horse owners have adopted it in practice. After removing the shoes, the horse is driven only a short distance daily, on a hard road, increasing gradually to from four to six miles in the course of a week. Water is not avoided, but grease is, as then nature is imitated the closest. Until the nail-holes have disappeared, i. e., grown out, the hoof will look rough, and crack off more easily than afterwards. The results of the trials reported seem favorable to the shoeless practice. At first the hoof chips off badly, but soon becomes hard, and the horse seems to like it as much as the urchin likes his bare-footedness. But the experience of generations of shod horses, and the facts and arguments in favor of no shoes, suggest a middle ground, viz.: for paved or stony streets and roads, a metallic shoe; and no shoes for smooth, even hard roads, for country roads free from stones, and for field work, especially on prairie and other farms where there are no stones, or very few. We are not familiar with any instance in America where the use of horses without shoes has been thoroughly tried,

Fig. 3.—THE SHOE IN PLACE.

but considering the great saving and possible benefits that might ensue, we suggest that the question is worthy of careful consideration, as it is certain that at no time is the horse's foot in so healthy a condition as when unshod. A near approach to nature, which allows of the foot resting squarely on the ground, yet at the same time protects the hoof from injury, is the Charlier system of shoeing, which now finds considerable favor in Europe. The method is fully described in the excellent work on "Horse-shoeing," by Mr. Fleming,* who says: "Leave the hoof in a natural condition, so far as frog, sole, and wall, are concerned, and imbed a narrow rim of iron, no thicker than the wall, around the lower circumference of the foot—that exposed to wear—like the heel of a man's boot, and we obtain an idea of the method."

The crust or wall is beveled off with the rasp, and by means of a knife with a movable guide, a groove is made to receive the shoe, as illustrated in fig. 1. The groove is a little shallower than the thickness of the sole, and somewhat narrower than the thickness of the wall, "not extending beyond the white line separating the sole from the wall." The shoe is a narrow but deep band of iron, narrower at top than at the bottom, and so forged that its front surface follows the slope of the hoof, as seen in fig. 3. Its upper inner edge is rounded by the file, and a little of the horn is removed from the angle of the groove in the hoof, which prevents undue pressure of the shoe against the soft horn at that place. In strong hoofs, the shoe is almost buried in the groove; but with flat soles and low heels, it is not safe to imbed it so deeply. Four to six light nails are used; with light driving horses four are sufficient,

placed wide apart at the toe, and close to the heel, as in fig. 4. Fig. 2 represents the shoe. It cannot be used on all feet, and to make the groove and shoe fit well requires some care; but when once understood by the farrier, the shoeing is said to be very simple. The advantages are: leaving the foot in its natural condition as to frog and sole, "the small number and size of nails required, lightness of the shoe, and security to the horse in progression," as it places the foot fairly upon the ground. It is used on horses at all kinds of work, and it is said that the combination of horn and metal stand an astonishing amount of wear for so light a rim of iron. These shoes are usually applied to only the forefeet, as the hindfeet are thought to be not so well adapted to them.

Fig. 4.—MANNER OF NAILING.

The Cultivation of Wheat.

Much interest is manifested in improved methods of managing the wheat crop. Hitherto the preparation of the soil and the sowing of the seed have comprised the whole work, and natural influences have been left alone to modify the results for better or for worse. But of late, the idea has arisen and been gaining in favor, that by making use of the same methods employed to forward the other crops, we could largely increase the yield of wheat; that by cultivating the grounds and destroying the weeds, the plants would be much strengthened and increased in productiveness. That this idea is correct, admits of no doubt; it is reasonable, and ample proof of its practicability has been given by both experiment and practice. In England, France, and Germany, it has been common, for many years past, to hoe the wheat, and to remove the weeds by hand; and of late years, horse-hoes have come into use for this purpose.

The articles published in the *American Agriculturist*, have given rise to numerous requests for further information and discussion of this matter. It is obvious that mechanical cultivation can be applied only to crops planted in rows, and that only drill-sown wheat can be worked by either hand or horse-hoes. It is impossible, in this country, to use hand labor profitably for hoeing wheat on a large scale, on account of its high cost. Horse-power only can be used, and the implement must be made to cover many rows at once. The drills must be separated by such intervals as will permit the safe passage of the hoes between them, and the machine must be carefully guided. In practice it has been found that 9 to 12 inches is the best distance. The defect in most drills as now made, of the spouts being too near each other, may be remedied by tying two of them together, or by removing each alternate one—thus doubling the width of the spaces between the rows. There is then ample room for cultivation. The illustration (see next page) shows the working of an implement such as the Travis hoe. As the frame which carries the hoes is loose, and oscillates somewhat, it is easily managed so as to avoid cutting the plants. The wheat-plant has two sets of roots; one springing from the seed, and another which starts from an enlargement of the stalk near the surface. The latter form the permanent roots, and as these spread, new spires appear above the ground, each of which throws out roots for itself and forms an independent plant, and this in turn increases in the same manner. By separating these new plants from the parents, and transplanting them, repeated several times, as many as 500 vigorous and distinct plants have been produced from one seed. It is thus seen with what facility the wheat-plant will spread when the best conditions for the exercise of

* "Practical Horse-shoeing," by G. Fleming. Published by Orange Judd Company. Price 75 cents, post-paid.

its natural habits are provided. This multiple growth is promoted to the greatest degree by proper fertilization and cultivation, as well as by giving the plants sufficient room to spread. The accompanying illustrations (figs. 1 and 2), indicate how this may and may not occur. At fig. 1 is shown a series of drills the usual distance apart, say 6 to 7 inches; at fig. 2 is a series at double the distance. The former is supposed to be left un-

Fig. 1.—WHEAT IN CLOSE DRILLS, UNCULTIVATED. The plants, therefore, have not sufficient room to spread their roots as becomes strong, healthy, actively growing plants. But in the case repre-

Fig. 2.—WHEAT WIDE APART AND HOED.

sented at fig. 2, a different condition prevails. Here there is room for the plant to spread its surface roots. The soil being opened by the cultivator, is aerated and warmed; the young roots soon occupy it, and the new plants quickly cover the feeding ground thus provided. The drills then appear as in the engraving, and early in spring a vigorous

Fig. 3.—THE WHEAT-HOE AT WORK.

growth hides the spaces between; while in the former case, open ground may be seen for a long time.

There are two ways in which we must improve agriculture; one is by making labor more effective, and to cover more ground by the use of the best methods; and the other is by increasing the yield of crops. By cultivating small grains, as we do corn and roots, we effect both of these desired ends, so far as the mentioned crops are concerned, at least.

Marking the Horns of Cattle.

A correspondent who pastures cattle for other persons, wants a method of marking to easily distinguish those of different proprietors. Steel implements are easily procured having the initial letters of the owner's name on one end. These, heated and pressed on the horns near their ends, give no pain, and leave permanent marks, which may be scraped or filed off if ownership changes.

HORNS MARKED.

The accompanying illustration shows how to mark the horns both with the marking iron and with a common coarse file. With a file one can make any letter or symbol consisting of straight lines, as V, A, W, N, M, etc.

A coarse mill-saw file, or a blacksmith's rasp may be used for a large number of different marks, and in most cases will be the only instrument required.

Making Ox-Yokes and Bows.

Ox-yokes may be of different patterns and styles, but they must be made upon a certain fixed principle, or they will be unsatisfactory in use. An ill-fitting yoke hurts the ox, either by pressing severely upon and galling the shoulders or neck, or by rising upon the neck and drawing up the haws, tending to choke him. Thus an innocent animal, though patient and willing, is often unable to work, and is esteemed lazy and stupid—is subjected to ill-treatment and abuse, with loss of temper by the owner.—The chief points to be considered in making ox-yokes, are strength and lightness of material; length, and the proper thickness consistent with sufficient strength; form and position of the bow-holes, with reference to the proper distance between the oxen; the size of the bows, and the position and form of the hollow resting on the neck.

The timber should not readily split; should work easy, and yet be light and strong. Basswood (Linden) has these qualities in a high degree. The next to be chosen is soft maple or butternut; after these, are cherry and walnut. The piece of timber for the yoke should be sawed 5 feet long, 10 inches wide, and 6 or 7 inches thick. In laying out the pattern, the line of draft is even with the eye of the bolt holding the ring, as the draft is from that point. The center of the pressure of the

animal's neck must fall exactly upon this line, or the yoke is forced to turn up or down, as the draft may be below or above this axial line. If the draft center is above it, the bows press unduly upon the throat; if below, the yoke slips back and chafes the neck, even if it does not choke by drawing the bow up against the throat. The hollow for the neck should not be above or below the curve or are of a circle, the center of which falls upon the draft line, and which are or curve touches the

lines of the bow-holes. This is shown at figure 1, where dotted circles are seen below *a, a*, the centers of which fall upon the dotted line passing through the eye of the draft ring, this representing the line of draft. The lines passing through the centers of these circles at *a, a*, will be the point from which the places for the bow holes are measured. (See *a, a*; also in fig. 2.) To get these points, cut a piece of board into the form of the diagram—5 feet long and 10 inches broad—and divide it into four equal parts by the lines *a, b, a*, figures 1 and 2. The center line, *b*, is the place for the draft ring, fastened by a clamp (fig. 7), as described below. Cut the timber by the pattern, and bevel the edges.

Fig. 1.—MAKING OX-YOKE PATTERN.

The top of the yoke is laid out as in figure 2. The bow holes placed at equal distances on each side of the point, *a*, are bored with a 2-inch auger from

Fig. 2. PROPER FORM OF YOKE, HORIZONTAL SECTION.

each side, meeting in the center of the timber, so as to get them straight; they are smoothed out

afterwards with a red-hot iron. For drawing a wagon, put the bow-holes nearer the center of the yoke than for plowing; and they may be changed—of course changing the center lines, *a, a*, and the neck curve, at the same time—to suit large oxen. For general use, the following sizes will be found about right: 10 inches between the bow-holes, and 20 inches between the two inside ones. For larger oxen, the lines, *a, a*, may be moved 2 to 4 inches nearer the ends, leaving the bow-holes 12 inches apart and 24 inches between the bows. The

Fig. 3.

Fig. 4.

sides of the yoke are then hewed out, as seen at figure 2; the bevels on the edges are rounded off; the hollows between the bows are sloped to give an easy fit, and all sand-papered perfectly smooth. The yoke should then be well seasoned under cover, and coated with linseed oil or crude petroleum. The haws should be of good hickory, or second growth white oak, or white ash; 27 to 30 inches in length, and 2 inches in diameter before being finally dressed. Soak the roughly dressed timber thoroughly in cold water for

two weeks; then steam, or soak in hot water, until pliable. Bend into shape, as at figure 3, by the frame shown at figures 4 and 5. It is a 4-inch plank 24 inches long and 16 inches wide, fitted with a number of holes and pins. For convenience, it may be mounted

Fig. 5.—BENDING THE BOWS.

on four legs or pegs, of any length desired. Bend the prepared timber around the three lower pins, *b*, and if not yet safe to bend it completely, leave it half bent, by putting in the pins, *a, a*, for a day to give it a set. The bent portion is then soaked or steamed in hot water until it can be safely brought up to the required form, when it is confined by the other pins and is left to dry and stiffen. By making the pins long enough, as seen at figure 5, several bows may be bent at the same time. When the bows are taken from the frame, the tops should be tied together, to keep them from losing their shape, until put into the yokes. Cut the key holes in the bows, as indicated at figure 6. To fit larger oxen, a second key hole may be made, two inches above the other one, or better in the other arm of the bow, so as not to weaken the first one. The key, made of iron, is shown at figure 6. It is flat, and when put in and turned half round it can not work out. The ring is attached by a broad iron strap clamping the yoke at the center, with screws and nuts at the ends. A plate of iron covers the top of the yoke, and is held by the screws and nuts of the strap; and two pieces of iron, which may be cast, and which fit together over the ring, are held by the strap and by a socket 1/4 inch deep cut into the yoke. The whole is clearly illustrated at figure 7.

Fig. 6. KEY FOR BOW.

figure 5, several bows may be bent at the same time. When the bows are taken from the frame, the tops should be tied together, to keep them from losing their shape, until put into the yokes. Cut the key holes in the bows, as indicated at figure 6. To fit larger oxen, a second key hole may be made, two inches above the other one, or better in the other arm of the bow, so as not to weaken the first one. The key, made of iron, is shown at figure 6. It is flat, and when put in and turned half round it can not work out. The ring is attached by a broad iron strap clamping the yoke at the center, with screws and nuts at the ends. A plate of iron covers the top of the yoke, and is held by the screws and nuts of the strap; and two pieces of iron, which may be cast, and which fit together over the ring, are held by the strap and by a socket 1/4 inch deep cut into the yoke. The whole is clearly illustrated at figure 7.

Fig. 7.—STRAP AND RING.

The Cost of Pennsylvania Crops has been investigated by Secretary Edge of the State Board of Agriculture. Circulars were sent to 200 practical farmers, asking the cost per bushel of the leading crops. The average result was as follows:—Wheat, 81.7 cts.; rye, 63.3; barley, 49; oats, 25.3; corn, 44.6; potatoes, 24.8. This includes interest, taxes, manure, labor, etc., and is the total cost.

Cooling Milk, or Milk Coolers.

Dairymen know, or should know, that it is necessary that milk should be cooled rapidly as soon as drawn from the cow, and kept cool until disposed of. Many methods have been devised for this purpose. We recently saw a plan, an improvement on the old-fashioned spring house, which has some useful points. A small building was erected a short distance below a strong permanent spring, from which water was led into it by a pipe. The floor was sunk below the level of the spring, and cemented water-tight. A tank of brick-work, cemented inside and out, was made, 12 feet long and four feet wide, or large enough to hold 40 cans, 18 inches deep and 8 inches in diameter, each holding 15 quarts or 33 pounds of milk. The capacity

Fig. 1.—TANK FOR FORTY CANS.

of this trough was therefore about 600 quarts, or sufficient for a milk dairy of 50 to 60 cows, yielding a daily average of 10 quarts each, or for a butter dairy of half as many, allowing the milk to set 48 hours. The water flowed into and through the tank, escaping at the lower end. Two lids of plank, covered with zinc, closed the tank and protected the milk from contact with the air. The delivery pipe

Fig. 2.—THE HARDIN COOLER.

is shown in fig. 1 by the dotted lines. Where flowing water can not be had, and where butter-making is practised, some other method must be employed. Of late, excellent results have been obtained by "cold setting" of the milk in refrigerating closets. Some time ago, we described the Hardin Cooler, which has been in use for some years, but has recently had several improvements added. It consists of a refrigerating closet, which is made of different sizes; that here illustrated (fig. 2), being for 10 cans, which are 18 inches deep, and 8 in diameter. The inside of the closet is lined with zinc, and a zinc tray, *a*, is suspended in the upper part to hold the ice. The drip from the ice escapes by a pipe, *b*, to which a piece of rubber hose is fitted. Formerly, the ice was placed upon a shelf, instead of a tray, and the water dripped upon the

Fig. 1.—FURNACE FOR BURNING STRAW, CORN-STALKS, ETC.

milk cans below. This change reduces consumption of ice; and this may be still more reduced by cooling the milk somewhat before putting it in the closet, when it is rapidly brought down to 45 de-

grees or less. A still lower temperature may be reached by putting salt into the pan. By this means the milk may be cooled to 35 or 40 degrees. At 45° all the cream should be raised in 24 hours. To test the temperature, a thermometer may be plunged into the milk when skimmed. In a trial of this apparatus during the hot weather of August, 50 pounds of ice per day was consumed; and the milk having been reduced to a temperature of 60° before putting it into the cooler, was brought down to 45 degrees in less than three hours.

Grass, Straw, and Corn-stalks for Fuel.

A method of utilizing coarse grass, straw, and corn-stalks, and other similar light combustible matters for heating, has been introduced into the Western States by the Mennonites recently settled there. These people come from Southern Russia, the country of the "Steppes" or treeless plains, which are similar in many respects to our extreme western prairies and plains. Thus they find themselves quite at home, and adapt themselves to their new circumstances with ease. Among others of their peculiar customs, their mode of heating their houses is certainly novel, and is one that may well be adopted by their neighbors. No more plentiful fuel than coarse prairie hay, straw, and corn-stalks, exists in many newly settled sections west of the Missouri river, and other kinds of fuel are scarce. Hitherto, means for conveniently burning such fuel have been unknown. The Russian plan, which is to make use of an enormous brick furnace occupying much room, is cumbersome and inconvenient; but the same principle may be applied in a somewhat different and unobjectionable manner. We give herewith a sketch of a furnace for burning light fuel of the kinds mentioned. It should be built of hard bricks laid in cement. The fire place *A*, figs. 1 and 2, should be large enough to take in a sheaf of straw, or a bundle of hay, or corn-stalks, and the cast-iron furnace door be of a corresponding size. The ash-pit *B*, figs. 1 and 2, is arched at the front and closed at the sides. The furnace should be built upon the ground and have a floor of hard beaten clay, or cement. The oven *C*, fig. 1, is of brick, in the usual form and heated separately, or it may be of cast or sheet iron plates like the ordinary stove. Dampers, *D*, *D*, *D*, direct the heat either to the top or to the bottom of the oven. Walls of brick are built to bring the flame to the roof of the furnace and to retain the heat as much as possible. Openings are made in the top at *E*, *E*, upon which

Fig. 2.
FURNACE FRONT.

to place kettles or cooking pots where they will receive the most heat. Arches, under the oven and the rear of the furnace, provide warm closets for various useful purposes. The furnace connects with the chimney through a throat which may be closed by the damper shown at *F*, which would cause the heat to pass up the pipe in front of the chimney into a sheet-iron drum in the room or central hall above. The heat is shut off from this drum, by the damper *G*. Two openings are left in the front of the furnace, one at each upper corner: and are supplied with sliding doors through which a small amount

of air is admitted when the drafts elsewhere are closed, as they should be at night or when a moderate heat only is needed. The arch under the fire-place should be closed by an iron

door, with a grated damper in the lower part. For the iron work of the furnace, the ordinary castings of the largest cooking stoves may be used, and can be procured from a dealer or stove foundry. If it is desirable to heat several rooms, an arrangement of pipes and drums, with dampers, may be made to circulate through the house, entering the chimney on the upper floor. One chimney only, in the center of the house, will then be required.

Cutting and Drying Peat.

Peat has been a very common fuel, in some countries, for centuries past. Its accessibility, its easy preparation, and its cheapness where abundant, give it value. Where peat swamps are convenient, and where the supply is sufficient, it compares favorably with either wood or coal for manufacturing purposes. We speak of it now, however, as household fuel. It is cleanly in use; it gives great heat, or it will smoulder slowly when desired if properly managed, ready to be quickly enlivened and burn briskly. It makes little smoke, and that light and free from soot; and the odor is pleasing to many; the "peat reek" from a Scotch or Irish cabin, being one of the things that a traveller in those countries remembers agreeably. It's one fault is, that the ashes are very light, so that when it is burned upon an open hearth they are floated out into the apartment with the least irregularity of draft. Many farmers who now procure wood or coal with difficulty, have an inexhaustible supply

Fig. 1.

Fig. 2.—ORDER OF REMOVING BLOCKS FROM BOG.

of this fuel at hand. Swamp-muck, as it is known with us, when consisting mainly of the half decomposed remains of roots and stems of woody shrubs and coarse grasses, furnishes excellent peat. When it is softer and more decomposed, it is not so easily handled in the drying, and there is some waste. As fuel, however, this, when dry, is equal to any. When the muck is mixed largely with clay or sand, it is less valuable. When these foreign matters exceed 50 or 60 per cent, the peat makes a poor fuel. When it is desired to work a peat bog or swamp, a drain is first made to carry off the water, the moss and upper stratum of

Fig. 3. DRYING THE PEAT.

Fig. 4.—THE DRY PEAT STACKED FOR USE.

spongy matter are removed, and the surface of the solid peat laid bare. A tool known as a skean (fig. 1), shaped like a spade, with the sides turned up about 3 inches at a right angle, and with a sharp

edge at the bottom, is used to cut out the blocks. These are cut in the manner shown at figure 2, and in the order indicated by the numbers, for the purpose of keeping the water at the lowest point. The digger stands on a plank lest the soft peat should be broken down by its trampling upon it. The blocks are laid to drain upon the edge of the ditch, and when hardened sufficiently by exposure they are put up to dry in the manner shown at figure 3. As the peats dry, they shrink largely, and when solid enough to withstand the pressure they are piled in stacks for final drying, as at figure 4. The stacks are covered with coarse hay to shed the rain. When thoroughly dry, the blocks are light, but solid, and will bear handling without waste.

In burning this fuel, care is needed to manage the fire with success. A block is first broken up and the pieces are lightly placed upon some shavings or other kindling. A few half blocks are laid over these, and then whole ones so placed as to leave as large air spaces as possible between the blocks. Thus arranged, they burn lively and make a bright glowing fire without flame, and with little smoke. It is a pleasant fire to broil meat over. When a slow fire is wanted the peats are laid close together, and some ashes drawn over them.

Packing Eggs for Winter.

Of the various methods practised for preserving eggs for winter use, one of the most effective is that employed by the dealers who buy when the supply is large and prices low. This is as follows:

Fig. 1.—VAT FOR PICKLING EGGS.

Brick vats, or wooden tanks, are constructed in cool dry cellars, partly sunk below the level of the floor, as in figure 1, the dotted lines showing the portion below the ground. These vats and tanks, —or casks, which may be used instead,—are partly filled with a preservative mixture of thick lime-water, or milk of lime, to which are sometimes added salt and a small quantity of cream of tartar (bi-tartrate of potash) and the eggs are placed in this mixture and kept covered. The eggs are placed in the tank by means of a peculiar dipper, (fig. 2) made of a round, shallow tin pan, with a long handle, the tin being perforated to drain off the liquid. The eggs are lowered to near the bottom, and gently rolled out, with little risk of breakage. Here they remain until required for sale. If they were fresh when packed away, they will come out after three or four months so little changed, that few persons would be able to distinguish them from fresh ones. When wanted for sale, they are taken out of the pickle with the dipper, and care-

Fig. 2.—EGG LADLE.

fully placed in the crate, shown at fig. 3. This is made of laths; but an open splint basket would answer the purpose as well. A large low tub, as half a hoghead, is provided, and two boards are placed across the top as seen in fig. 4. The crate of eggs is placed upon the boards, and water is run through it until all perceptible traces of lime are removed. In this method of preservation, there is nothing that may not be done in a small way, and with any substituted apparatus which will answer the purpose. One thing is imperative—the eggs must be fresh when packed, or they cannot be kept in a good condition for several months.

The Lack of Educated Veterinarians.

BY A. LAUTARD, M.D., V. S.

Inducements to Young Men to Study Veterinary Surgery and Medicine.

The *American Agriculturist* for September, contains an excellent letter from one "Among the Farmers." His hints on treating ailing animals, on Veterinary Surgeons, etc., are very good, and as one among the Veterinarians, I would say a few words in confirmation of your correspondent.

That the number of educated Veterinarians is yet far below the requirements of the country, every one knows, and it will probably remain thus for some years to come. Why should Veterinary Science stand so low among us, while the number of domestic animals is so great? It is not merely because our people are ignorant of the real value of the profession, for every one will admit that Veterinarians are much needed, that it is a difficult profession to master, and that it requires as much study as to become a physician, if not more. It is rather because those engaged in the profession, generally speaking, have proved unworthy of the confidence of the people, either by their conduct or by their ignorance and their own social standing. Scarcely one respectable veterinarian can be found where there are ten such pretending practitioners. This being the case in many large cities, what must it be in the country?

It was to remedy such condition of things that Veterinary Schools were started. I would here correct an error of your correspondent. He says: "We have two or three Veterinary Schools." There is at the present, only one Institution entirely devoted to the study of Veterinary Medicine, in active working order, viz., the "American Veterinary College," situated in New York City, at 141 West 54th St., which has been frequently announced in the columns of the *American Agriculturist*. This Institution, far from "struggling with poverty or lack of appreciation," is in a prosperous condition and is fully satisfied with the success it has met since its opening. Its facilities are as good as those of any of its kind; it has a faculty of eight professors, who, since 1864, have been lecturing every session. This College is well prepared for work; its lecture-rooms and dissecting room are every winter well filled by students from all parts of the country, while the museum contains

Fig. 4.—TUB FOR DRAINING THE EGGS.

nearly 3,000 specimens for illustrating the lectures. The hospital and clinics brought last year nearly 1,500 patients [diseased animals] before the class. So far from fearing as to its future, the officers are now puzzled to foresee how they will accommodate their class a year or two hence. The Alumni of the "American Veterinary College," are, of course, yet few in number, but these few are to be found in the States of New York, New Jersey, Pennsylvania, Massachusetts, Illinois, Maryland, Ohio, etc.; and they now form the nucleus from which Veterinary Science will extend its influence far and wide.

Other schools have been started in different parts of this country, but, for reasons easily understood, all have failed. The "American Veterinary College" has proved a success because it was not started for money-making, but for scientific objects, and, with the officers who undertook to carry on the work, it could not prove a failure.

Your correspondent asks, "Why should not Physicians treat animals as well as men?"

Fig. 3.—CRATE FOR IMMERSING EGGS.

In the present condition of the country, with almost no Veterinarians of education, I, as one of them, accept this proposition, and say that rather than to trust to nature alone, and certainly instead of leaving our animals in the hand of every empiric, quack, horse doctor, or any impostor of that sort, by all means let our Physicians give timely assistance and good advice.

But is it necessary that we should depend on our medical man for advice as to domestic animals, and would he be the proper man for that double work? —We doubt it much; though similar in generalities, the two branches of medicine are so different in their details, that it seems to be asking too much of a man to be both a good V. S. and a safe M. D.

Let young farmers look at the veterinary profession in its proper light; let them remember that it will require hard study and steady application before they can qualify themselves for practice; let them appreciate the fact that veterinary medicine is not merely *horse-doctoring* or the like, but that it is a profession of science and of learning—one which is of the greatest importance to our national wealth—agriculture being the wealth of a country. Let them impress their minds that it is not the profession which makes the man, but the man who makes the profession, and I am sure that but very few years will pass before a sufficient number of educated men will be found to remedy the need at present so much felt by our farmers. Let me add a few words, which I am sure will carry weight in favor of veterinary science. Out of the whole list of the Alumni of the "American Veterinary College," there is not one who does not command a paying practice of from \$1,500 to \$4,000 a year; and this not after several years from the time of graduation, but in some cases in a few months after leaving college. What business, what trade, what other profession, offers to young men greater inducements?

[In allowing this well deserved praise of the Institution mentioned, the impression may be conveyed that there is no other Veterinary College in good standing in America, which our Canadian neighbors may resent, as there is an excellent Veterinary College at Montreal, which we do not doubt graduates skillful practitioners.—Eds.]

A Safe Tether.

In tethering animals, the danger of the chain or rope winding around their legs and throwing or fettering them, may be avoided by attaching a strong rod, as a portion of a young hickory sapling, about 8 feet long, to the end of the tether, and by a short chain not more than 2 feet long to the neck strap

A COW TETHER WITH ROD.

or headstall. The end of the rod nearest to the animal is thus raised a little from the ground when its head is up, and cannot be interfered with by the feet, nor can the tether chain become entangled about the legs. The method of attaching the rod is shown in the accompanying illustration.

Color of Farm Buildings.

In painting even a shed it is just as cheap and easy to give it a pleasing color, as to make it a blemish on the landscape. Barns and other farm buildings, painted red,—especially the dark Venetian red—offer a fine contrast to the green of the fields and trees, and we are pleased to note that the use of this color is increasing. The numerous red buildings of English farms are very attractive to the traveller's eye; and they are not only handsome in appearance, but also give an air of thrift and permanency to a place, which unpainted wood, or white or straw color, do not impart. We

have one set of farm buildings in mind, in which the brackets and other trimmings are finished off in black, with a most satisfactory effect. The black thus used, gives a distinctness and boldness to the details, and forms with the red walls a happy combination, and one most appropriate in its place. Red barns and out-buildings are not rare; these, when of a glaring, self-asserting red, are not pleasing, and they are still less so, when they are, as we often see them, trimmed with white. It is a rule of good taste in painting buildings, to have window caps, brackets, and other details, darker than the ground work or main body of the material. Why not apply the same principle to farm buildings, especially as it costs no more, and adds to the attractiveness and value of the structure?

For example, a brick house, with a white-marble door way, window seats and caps; and a white cornice, will always look frivolous and cheap; where the same details are of the much cheaper brown-stone, the house has an air of dignity and repose, quite lacking in the other. Other farm buildings are often quite as conspicuous as the dwelling, and in decorating them, quite as much thought should be given to having them pleasing to the eye, especially as it need not require an extra outlay.

The Agricultural Display at the Paris Exposition.

[From Our Special Correspondent.]

The American exhibit is small, but excellent so far as it goes, and evidently attracts much attention from foreign agriculturists, many of whom have given sample orders for some of the improved machinery. The articles exhibited are in what is known as the "American Annex," occupying two-thirds of this building, the other third being devoted to vehicles and their accessories, and miscellaneous tools and implements.

A collection of State exhibits occupies a prominent position in the center of the building, consisting of a large variety of seeds tastefully arranged, dried fruits, wool, cotton, specimens of the different woods, and tobacco growing in pots. About this central point cluster exhibits of agricultural tools and implements of various kinds, many of them being supplied with power, and shown in actual operation. Among the most prominent exhibitors are Walter A. Wood, of Hoosick Falls, N. Y.; the Johnston Harvester Co., of Broekport, N. Y.; D. M. Osborne & Co.; Warder, Mitchell & Co., of Springfield, O. (manufacturers of the "Champion Mower"); C. Aultman & Co., of Canton, O. (manufacturers of the "Buckeye Harvesting Machine"), etc., etc. Fairbanks & Co. make a splendid exhibit of their scales, several of which are adapted to weighing by either the English method or the French decimal system—a happy idea.

The English display, located in the adjoining pavilion, occupies a much larger space, and is very creditable. All the best-known manufacturers of agricultural machinery are represented, and their exhibits show a variety and perfection of detail which have surprised many Americans who supposed that improved farm implements were peculiar to their own country. Probably England has never made a more complete exhibit of her skill in this line, and the effort will no doubt prove remunerative, for the French agriculturists, with increasing faith in the stability of republican government, are now keenly alive to everything that means improvement and development, and they stand ready to take hold of whatever promises them assistance.

The French display is remarkably full. Evidently, no trouble or expense has been spared to make it as complete as possible, and the result, due in a great part to forethought and proper organization, is highly creditable, the collective exhibits being by far the most interesting and instructive. The "French Machinery Pavilion" is mainly devoted to "Materials and Processes in Agriculture," a few of the most important deserving more than the passing notice which we can here give them. Indeed, many of the single exhibits offer sufficient material for special articles. The Gennevilliers exhibit illustrates in detail the method of irrigation

adopted in the Plain of Gennevilliers, located six miles from Paris (nearly opposite San Denis), where the sewers of Paris pour out their immense tide of refuse. Samples of this sewerage are shown in bottles. It consists of a thick, black, greasy liquid. What to do with it was for a long time looked upon as a difficult problem. To let it escape into the Seine—a comparatively small stream, as rivers go in America—was not only to pollute its waters, but to waste a valuable fertilizing agent. But how to utilize it! Somebody had a happy thought—to conduct it to Gennevilliers' Plain, and use it for irrigation. This plan has proved a complete success, and led to developing one of the most extraordinary agricultural districts in the world. A sort of miniature lysimeter is on exhibition, 2 ft. by 18 in. and 3 ft. deep, with glass sides, showing the character of the soil thus fertilized, and with four cocks in the bottom, to let out the moisture, and admit of its being analyzed. A variety of specimen fruits and vegetables, grown on soil of this kind are shown, all remarkable for their great size, and healthy appearance. A large variety of natural and artificial manures, are shown in the same building, many of them accompanied by interesting reports upon them, and on the results that have attended their use.

Crossing the foot-bridge over the street, we enter now, Pavilion No. 1, devoted to "Agricultural Products," including seeds, geological collections of soils from different sections of France, various fruits and grains of all kinds, feed for animals, specimens of timber, wool, beets and beet-sugar, hand-tools, churns, models showing the diseases of cattle, and accompanied by suggestions as to their treatment, artificial cow and goat-milkers, etc., etc. The most prominent displays in this building are the following: The collective exhibit of the Department of the North, including a remarkable display of wheat, flax, sugar-beets, etc.; the exhibit by the Arcy Dairy Farm, owned by L. Nicholas; exhibits of teasles, poppies, and coniferous seeds; a variety of views showing the plan and arrangement of model farms; and that of A. Bignon, of Theneville, Department Allier, consisting of thirty water-color drawings illustrating the comparative condition of his farm in 1849 and 1878.

Pavilion No. 2, "Materials for Agriculture," is mostly filled with plows, which are shown in a great variety—nearly all of them being provided with wheels. Among them are scattered numerous machines for sowing and harrowing, hay-cutters, and boilers for preparing food for cattle and pigs.

Pavilion No. 3, "Agricultural Products," includes collective exhibit by the *Société Centrale d'Agriculture de Meurthe and Moselle*, showing wine, wool, hops, etc.; a huge diagram representing an analysis of different varieties of feed given, from 1872 to 1878, to the horses employed by the *Compagnie Générale des Voitures* in Paris (If their condition is a safe indicator, beware of feeding American horses on the same system); samples and analyses of different soils in Eastern France; a beautiful model of the Cosdon Farm (G. Cuisson, proprietor), in Canton d'Eroy-Aube, France; exhibits of honey, pelts and potatoes; silk worms and silk culture, shown in all stages; a large exhibit by *L'Ecole Pratique d'Agriculture*, of St. Remy, Department Haute Saône, France, including working drawings and plans of farms, with arrangement of the different buildings, a working model of a piggery, executed by one of the pupils of the school; economical herbs; oils; a grand exhibit by the *Ferme Ecole de la Plétière*; working models of stables and farm buildings, made after the "System Toilet" (address, No. 16 Rue de Grammont, Paris); and lastly, an exhibit of the method of mechanically

feeding and fattening poultry, etc., accompanied by a fine series of pictures illustrating the process.

Just in front of Pavilion No. 3 is a smaller structure, always crowded with visitors, which contains a number of incubators, and chickens and ducks in all stages of development; another containing model stables; and a third devoted to cut-flowers, which, to the writer, was one of the most fascinating resorts on the grounds.

Near the bridge which leads to the Trocadero is still another great building in which France displays the results of her persevering efforts to develop to the utmost her agricultural resources, and it somewhat tones down the opinionated American who has previously been sure that his country is ahead of the world in all that pertains to agriculture. France, with a territory smaller than that of the single State of Texas, shows her agriculture to be in a condition which America may well study and emulate.

PARIS, August 13th, 1878.

G. W. W. H.

A Yoke for a Sucking Cow.—"J. W. S.," sends a method of yoking a sucking cow, so that she cannot exercise her disagreeable habit. The yoke is made of two boards, 8 inches wide, and 2½ feet long, hollowed out to fit the animal's neck when put together, as shown in the cut. The yoke is held together by two cleats, with two bolts each; the ends of the cleats are pointed, and project a few inches. When the yoke is hung upon a cow's neck, and she turns her head to suck herself, the pointed cleats come against her side, and effectually prevent her from reaching her teats.

Cutting Large Logs for Firewood.

"A Subscriber" wants a method of using a horse-power with a drag-saw for cutting large logs into firewood. A simple arrangement for doing this may be made as follows: A drag-saw is attached to the balance wheel of the horse-power, the wheel having a crank rod attached, as indicated in the illustration. This rod may be made of tough hickory or oak. The saw is pivoted to the shaft, as shown in figures 1 and 2. The forward part of the crank rod rests and slides in a groove or guide in a post of the foundation timber (fig. 1). This guide is arranged so that the saw will not drop

Fig. 1.—DRAG-SAW FITTED TO HORSE-POWER.

lower than the bottom of the log, and not cut into the log carriage. In figure 2 the crank is made to give a reciprocating motion to the saw by the lever, *a*, the guide being at *b*. The log carriage may be a common sled, upon which the log may be rolled

Fig. 2.—SHOWING CRANK AND LEVER ATTACHMENT.

and drawn to the saw; the log should rest upon rollers so as to accommodate the saw, and be blocked up to keep it steady. The supporting frame is shown in section in both of the above illustrations.

The Animal Poison of the Far West.— "Loco" or "Crazy-Weed."

BY PROF. ASA GRAY.

[For several years there have been vague reports concerning the poisoning of domestic animals by some plant or plants in the far West, but we had been unable to learn anything positive concerning it. When Doct. Gray started last year with Sir Joseph D. Hooker to explore portions of the Rocky Mountains and California, we directed his attention to these reports, and asked him to endeavor to ascertain something definite concerning the trouble and the plant causing it, but his journey was made too late in the season for him to learn much concerning it. Since then letters and specimens have come from those having a personal knowledge of the injury to animals; these were placed in Doct. Gray's hands, who in the following article sums up the present botanical knowledge on the subject.—Ed.]

The papers for several years have abounded with accounts of a deadly Rattleweed, and of the havoc it makes of sheep and goats, as well as other cattle, in the southern parts of California. The following are examples of the letters we receive in respect to this notorious cattle-poisoner of Colorado.

Early in May specimens of the plant came through the kindness of a friend from a drug firm in Hutchinson, Kas., who wrote:

"We send a sample of a plant called by Mexicans and Spaniards 'Loco,' and by our stock dealers, 'Madweed,' 'Crazy Plant,' etc. It is death to cattle, sheep, and horses, and seems to be known only in a strip of country from Indian Nation, westward to California. The peculiar influence on stock is manifested by making them 'crazy.' They have dullness of vision, thirst, dizziness, and finally coma and death. Some of our stock dealers have lost as many as ten horses this spring from its effects."

In the following June, specimens were sent to the Editor of the *American Agriculturist* by F. T. Brooke, Esq., of Huerfano Co., Col., who wrote:

"When eaten by stock it renders them perfectly crazy. It is called by the Mexicans 'Loco' or 'Crazy-weed.' A few mouthfuls will not affect an animal, but he soon becomes attached to it as a man does to whiskey, and will eat nothing else. The animals eating it are affected differently: some become perfectly wild, refuse to be ridden or worked, while others become listless, stupid, and unfit for anything. Some pine away and die; others live on year after year, but are utterly worthless, unless stabled and allowed nothing but hay and grain; under such treatment some recover entirely, but are apt to commence eating the weed again if turned out to graze."

In order to obtain all the facts possible, the Editor addressed to Mr. Brooke a series of questions, to which the following came in response, and will indicate the character of the questions:

"To the best of my knowledge and belief, the 'Loco' is the plant that does the damage. I have seen horses eating this weed by the hour, without

touching anything else, and these horses were affected as described in my first letter. Although there is great difference of opinion in regard to another weed that we have, which seems to be fatal to cattle only, all stockmen agree that 'Loco' is the weed that affects our horses. There are very few mules in my immediate neighborhood, and I have never known any to be injured by it, but oxen and cows are affected the same as horses. But I do not think they eat it as readily as horses, for we have very few injured by it, whereas I have known of an entire herd of horses being injured more or less by it. We have no hogs, except what are kept up. I do not think sheep are injured by it. I

and commence again when the first snow falls. Animals are injured by it, I think, regardless of color. Here, where I live, at the foot of the mountains, the plant is common everywhere. I have none in my pastures, having taken the precaution to dig it up, but I understand from others that when cut and dried with hay it is not injurious."

The plants pointed out to us in both regions, or sent for naming, have all been of the Leguminous family, and of the *Astragalus* tribe.* The species to which this damage is attributed in the plains of Colorado, proves to be the *Astragalus mollissimus* of Torrey—a very downy species, as its name indi-

cates—and to show what it is like we have here given a figure of it. We never found this species on the mountains. But there the same ill effects are charged upon plants of similar appearance, belonging to a nearly related genus, *Oxytropis*, mainly to *O. Lamberti*, which abounds at all elevations up to 8,000 or 9,000 feet. The botanical difference between these plants is so little that they might all be counted as species of *Astragalus*; but there is reason to think that this particular *Astragalus* of the plains of Southern Colorado is much the most dangerous. For this species is not found as far north as Wyoming and Nebraska, where the *Oxytropis* abounds on the plains; and there we never heard of this trouble. There was a prevalent notion that plants of the Pea tribe (Papilionaceous plants) generally are innocent, if not wholesome. No one suspected a tribe which gave us peas, beans, lentils, and the ubiquitous pea-nut, and supplies such fodder as does Clover, Medick, Lucern, Vetch, and Cow-pea. In the first edition of his "Natural System," Lindley wrote: "The general character of this tribe is its nutritious, or at least, wholesome properties." Later, the note is changed, and in the "Vegetable Kingdom" he declares of the order, "that upon the whole it must be considered poisonous, and that those species which are used for food by man or animals, are exceptions to the general rule; the deleterious juices not being in such instances sufficiently concentrated to prove injurious." What a pity that our cattle are not better acquainted with the corrected rule! In Europe, and in the Atlantic States, no harm is known to come to cattle from want of proper discrimination. But

when European flocks were taken to Australia, and to pasture and forage almost wholly new, thousands of sheep perished in the Swan River

* But Mr. Sereno Watson, when in Utah, was shown a "Crazy-grass," growing along the banks of the Jordan, which was said to craze horses that fed on it. The grass was *Phalaris arundinacea*, the Reed Canary Grass, which has always passed for good fodder, and was never known to affect the intellects of horses or cattle in other parts of the country or in Europe. Probably the grass got the bad reputation, but some *Astragalus* did the deed. But there are "Crazy Grasses," one in S. Africa, one in Mongolia. Even the most reputable families—and the Grass family is at the top of the list—may have some disreputable members, like the "Drunk Grass" of S. Africa.

THE "LOCO" OR "CRAZY-WEED" OF THE FAR WEST.—(*Astragalus mollissimus*.)

don't know that they ever eat it; I have seen them in the midst of it, and could not see that any of it had been eaten. I do not think it affects the bowels or urine. I have heard (but won't vouch for the truth of it) that the brain of horses dying from eating the weed, is entirely destroyed. Hence a legend among some of the cow-boys, that it is a worm in the weed that finds its way from the stomach to the brain which it eats up. I know of no cases where horses died immediately from eating it. I do not think, as a rule, that it is fatal. It is supposed to be equally active at all seasons, but I think horses acquire a taste for it in the spring; it is one of the first green things they can get, and they eat it in preference to the old grass. If kept up until the grass gets a good start, they scarcely ever touch the weed. I have never had any horses affected by it, as I feed hay and grain until June,

Colony in consequence of cropping the leaves of some leguminous plants to which they were attracted. What made the matter worse for the botanists, was that the very plants which did the mischief had been recommended by one of them (Mr. Preiss, a German,) "as the best thing the Agricultural Society could cultivate, as artificial food for stock." But another botanist, Drummond, a canny Scotchman, got up some experiments, and proved that the people were right in charging the damage to these very species (of *Gastrolobium*) which the German botanist on general principles, expected to be innocent and useful.

Fig. 1.—REMOVING THE BALL.—(See next page.)

The same plants are fatal to goats, and even to cows and horses. The symptoms, as described, are almost exactly like those produced by the Loco-weed. In other parts of Australia, species of a different genus (*Swinsonia*), very like *Astragalus*, and like the Bladder Senna (*Coletea*), destroy cattle in the same way. Now the leaves of Bladder Senna, like those of true Senna, contain some *Cathartine*, and purge but do not poison. Those of the poisonous species in Australia are

solation that this is not a new thing under the sun. The next thing is to learn, if possible, the exact nature of this fatal affection. For this it is desirable that some competent persons, both in Colorado and California, should make *post mortem* examinations of the stomach and brain of some of the various affected animals, of sheep as well as cattle and horses.

Early Peaches—The "Waterloo."

When "Hale's Early" made its appearance some 15 or more years ago, it marked an advance in peach culture, much as the "Early Rose" did in potato growing. In both cases we have gone far in advance of these, but they showed possibilities, and served as a sort of standard for the comparison of new comers. The fair quality, great beauty, and especially the earliness of "Hale's Early," caused it to be very widely and largely planted. But a general disappointment followed, for save in a few localities the fruit, as soon as about to ripen, commenced to decay, and it at present proves profitable in the hands of but very few. The "Early Beatrice" came next; it was claimed to be earlier than Hale's and free from its fault; but it proved quite too small for profit, as did some others of Rivers' seedlings introduced at the same time. Following these were numerous native seedlings, largely from seed of Hale's Early, until at the present time the number of varieties claiming the title of "earliest and best" is so large that even those who make a specialty of raising peach trees and peaches can hardly keep the run of them. These new varieties come from several States, and each season adds to their number. Several of the prominent new early peaches are so nearly alike that one so experienced as Charles Downing, in speaking of some of them in a recent article in "Gardeners' Monthly," says:

ties to be earlier than the other. Our correspondent, R. J. Black, Fairfield Co., O., found that both "Alexander" and "Amsden's June" commenced to ripen June 28th, and that half the crop was ripe on July 4th. He says of these: "These two are very much alike in tree and fruit.... 'Alexander' is probably a little the larger, while 'Amsden' is the greater bearer. Not that 'Alexander' is at all shy, but 'Amsden' is profusely productive and imperatively needs thinning. Both are of fair size, attractive, and of good quality."—We agree with Mr. B. that ripe peaches in Fairfield Co., O., the first week in July, "is something to be grateful for."

Fig. 2.—THE BALL REMOVED.—(See next page.)

Knowing Mr. Randolph Peters, Wilmington, Del., to be largely engaged in growing peach trees, and to be thoroughly familiar with the orchards of the great peach district comprising Delaware, and parts of Maryland and Virginia, we requested of him a report of the new early peaches during the past season. Mr. P. writes substantially as follows: "There are so many new extra early peaches that

NEW EARLY PEACH—"WATERLOO."

found to contain an alkaloid, apparently *Cytisin*, to which the injurious properties are due. What we have to suggest, is, that the herbage of *Loco*, and of some of the Californian *Rattle-weeds*, should be submitted to chemical analysis, to determine if they contain an alkaloid, and if it is the same or similar to *Cytisin*. No antidote has yet been found, so far as we know. If any should be discovered, and if the poisonous principle proves to be essentially the same in Australia and in the United States, the same treatment would be applicable to both. All that the botanists can now do is to indicate the source of the trouble, and to offer the poor con-

"If the four kinds were put in a dish it would puzzle a good pomologist to separate them, and yet there is no doubt but they are all distinct kinds." This close resemblance is not to be wondered at, when we recollect the marked tendency of some varieties of peach to reproduce themselves in their seedlings, and it is very probable that the kinds so much alike are seedlings of the same variety. The two most prominent of the newer early peaches are "Amsden's June" and "Alexander," varieties so nearly alike that some claim them to be identical. We find that reports differ as to the relative earliness of these, each being claimed in different locali-

ties to be earlier than the other. Our correspondent, R. J. Black, Fairfield Co., O., found that both "Alexander" and "Amsden's June" commenced to ripen June 28th, and that half the crop was ripe on July 4th. He says of these: "These two are very much alike in tree and fruit.... 'Alexander' is probably a little the larger, while 'Amsden' is the greater bearer. Not that 'Alexander' is at all shy, but 'Amsden' is profusely productive and imperatively needs thinning. Both are of fair size, attractive, and of good quality."—We agree with Mr. B. that ripe peaches in Fairfield Co., O., the first week in July, "is something to be grateful for."

Georgia, Texas, and Florida. The Early Beatrice is too small, while Early Louise and Early Rivers are too late to come in competition with Amsden's June and Early Alexander. Reports from all sections place Amsden's June and Early Alexander as the best so far as tested. Among the many new extra early varieties on trial there may be some superior to these, but I think it would be well to wait until they are fully tested before planting largely of them."

While the matter of early peaches was under consideration we received, on July 21st, from Ellwanger & Barry, of Rochester, specimens of a peach of such fine appearance, good size, and, considering its northern locality, marked earliness, that we had a sketch of it made, and asked for further particulars. This variety seems to be of sufficient promise to warrant the engraving here given. The name "Waterloo" has been given to this peach, as it originated in a private garden in a town of that name in Western New York. It was first brought to the attention of Ellwanger & Barry last year, when they were so much pleased with it that they bought the tree and commenced propagating from it. The first fruit was picked on July 14th last, and on the 19th the fruit was over ripe, this being earlier than the Alexander and Amsden in neighboring gardens. The following description is by the skilled pomologists who sent us the specimens:

Size—Medium to large; for an early peach very large—specimens measuring nine inches in circumference, and weighing five ounces. A peach picked July 14th inst., measured *ten inches* in circumference.—*Form*—Round, with a deep suture on one side from stem to apex; stalk cavity deep; apex slightly depressed.—*Color*—Pale whitish green in the shade, marbled red, deepening into purplish crimson in the sun.—*Flesh*—Greenish white, with abundance of sweet vinous juice; adheres to the stone like Hale, Amsden, Alexander, and all of that class.—*Glands*—Reniform.—*Season* in Waterloo, N. Y., this year, July 14th to 19th, and might have been picked on the 12th.

Messrs. E. & B. have since written that the Waterloo proves to be an excellent keeper, specimens that had been picked a week showing no signs of decay. We had noticed this peculiarity in the fruit that was sent us; after making the journey from Waterloo to Rochester, and thence to New York, the specimens were placed in the artists' hands, and when they returned to us after the lapse of two days, were still in good eating condition. Of course the real value of this peach will not be known until it has been cultivated in other and widely separated localities, but it at present promises to mark a great advance in early peaches—a promise which we trust its future may substantiate.

Preparing for Winter—Repotting

Those who cultivate house plants are apt to postpone preparations until cool nights, if not actual frosts warn them to bring their plants under cover. It is a great mistake to thus delay this work, and those who have heeded our monthly "Notes" do not need our present reminder to attend to it without delay. Plants that have been turned out of their pots and have been in the open ground all summer, often become over-grown, and too large to take up and pot for the window garden; hence we have at various times during the season, advised starting new plants from cuttings, as vigorous young specimens are usually more satisfactory than old ones. Still there will be some that it may be worth while to take up, and these should be attended to at once. When a plant is changed from a pot to the border, the heretofore cramped roots soon take a new start, spreading as if they enjoyed their new liberty, and soon occupy several times their former space, while the upper portion of the plant soon grows proportionately large. When such a plant is taken up in the fall it will have a mass of roots, not only far too large for its former pot, but too large for any pot that one would care to give it. The roots must be cut away to a convenient size, and the top must be reduced also. Here is the point where novices fail; they dislike to part with any of the luxuriant new growth, but

set the plant with all of its top and only a part of its roots in a pot, and expect it to flourish. It may be taken as a general rule in all transplanting, whether with house plants or with trees—the top must be reduced in proportion as the root surface is diminished. Plants taken up from the open ground must be placed in the shade until they recover, and they must also be sheltered from the drying influence of the wind. A large share of window plants are properly kept in pots during the summer, with the care advised in our monthly "Notes." Before these are taken to their winter quarters all the preparatory work should be done. If they do not need repotting, the pots will require washing, and it will be well to remove the surface soil and give a dressing of fresh earth. It is likely that many will be found on examination to require new pots. Whenever the roots have filled the ball of earth and have begun to form a mat on its surface—for when they reach the pot they can go no further, and begin to coil around the ball—then another pot is needed. The examination of the ball is a very simple matter, but it often astonishes a novice to see the ball removed, examined, and replaced, by one accustomed to the operation. To show the manner of removing the ball of earth from the pot, we present on the preceding page two engravings prepared for "Winter Greenhouses at Home," an excellent guide to the inexperienced in window culture. To remove the ball, spread the left hand over the top of the pot, allowing the stem of the plant to pass between the fingers, and with the other hand on the bottom, invert the pot, as shown in figure 1; holding it in this position, give the edge of the pot a downward tap against the edge of a bench, or similar surface, and the ball will usually become loose, and allow the pot to be lifted off, as shown in figure 2. If it does not drop out at the first tap, repeat, giving stronger blows, and on other parts of the rim of the pot. A plant must be very much pot-bound if it can not be readily removed from a pot of the proper shape, by this method. In case this does not succeed, pour a little water around the edge, and allow it to soak awhile; a very bad case may require the use of a case-knife, which is to be run between the pot and the ball, though this will rarely be necessary. After the ball has been examined, put on the pot again, turn it upright, and settle the ball in its place, by setting the pot down with a thump. If the ball is well filled with roots, and they seem disposed to curve around the ball, as if in search of fresh earth, it needs repotting, changing to the next larger size pot. The pot, if an old one, should be clean, and if a new one, it should be soaked in water, until the pores are filled, and allowed to drain off, so that the surface will not be wet when used. Place a bit of broken crock over the hole in the bottom of the pot, put in soil enough to bring the ball up to the proper height, and then having set the ball in the middle, fill in the space between that and the sides of the pot with soil, using a piece of shingle, or something slender to press down this new earth and make it firm, give water, and the job is done. It is well to remove whatever of the old soil will readily come away from the top of the ball.

A New Method of Multiplying Plants.

One Ossenkop, an Austrian, has published a work on, and contrived various appliances for, a method of propagating plants which he claims to be new. The inventor, it appears, has been all over Europe and parts of Asia and Africa to introduce his novelty—for which, no doubt, he receives a consideration. In a recent number of the "*Revue Horticole*," its correspondent, J. B. Weber, gives an account of the method of Ossenkop, which turns out to be not so very new, and it is very likely that it is, after all, an American invention. In 1866, in conversation with that well informed horticulturist, Doct. John A. Warder, we mentioned the difficulty attending the growing of the Delaware and certain other grape-vines from cuttings in the open ground. He remarked that his friend, Wm. Patrick, a nurseryman at Terre Haute, Ind.,

grew such cuttings without difficulty, and would no doubt communicate his method. We accordingly wrote Mr. Patrick, and with the liberality that characterizes a true horticulturist, he at once complied with our request, and gave his plan. Mr. Patrick did not run about the country selling his secret, nor did he put it in a little pamphlet of half a dozen pages and charge a dollar for it. He not only sent it, but added: "If you can make any use of it for the benefit of horticulture, please do so, as anything of this kind should be open to all." Mr. P.'s article was published in the "Horticultural Annual" for 1867, and some time after it was given in substance in these columns. The method is in principle precisely the same as that of Ossenkop, though that person mystifies it by making it appear that certain double-bottomed boxes and other "fanciful applications" are necessary. As this method of striking cuttings may be new to most of our present readers, we give it as a timely article, and insist that, unless the Austrian can show prior publication, the credit belongs to Mr. Patrick. Mr. P. says:

"Before the ground freezes, I make the cuttings, from four to six inches long, with one or two eyes on each. I prefer to have two eyes, as such cuttings seem to be better able to withstand the drouth we are apt to have the last of May or the first of June. The cuttings are tied in bundles of about fifty each, and their lower ends are puddled by dipping them half their length in mud, made of loamy soil, mixed with water to about the consistency of cream. A cold frame has been previously prepared with good sandy loam, but not rich. In this I place the cuttings, *top end down*, and sprinkle in fine earth, so as to fill all the spaces in and between the bundles. The crevices all being filled, sufficient earth is put over the cuttings to cover them about four inches deep, and they are left in this condition until they have been rained upon, and it begins to freeze. I then cover the bed with a mulch of leaves or straw, and over this a shelter of boards. If I wish to plant early in the spring, I remove the boards and mulch, and place a sash over the bed, taking care to leave an opening for ventilation; water is to be given as needed. In about five weeks the cuttings will almost all be found to have formed roots from one to three inches long, while the buds have swollen and are just ready to burst. The cuttings are now in a condition in which they require careful handling, and they should not be allowed to dry. I usually set the cuttings, as they are taken from the frame, in a bucket containing some water, and in this way carry them to the place where they are to be planted. In planting, I set the cuttings so that the upper eye is just below the surface, and press the soil firmly around them. Treated in this manner, the cuttings will nearly all grow, and make very strong vines. If there is no cold frame at hand, another plan may be followed. The cuttings being prepared as above directed, are buried, *lower end up*, and four inches deep, in some place sloping towards the south, with the ends inclining towards the south; they are to be covered with a mulch, in the same manner as described for those in cold frames. The mulch is removed in the spring and the earth exposed to the sun. Cuttings treated in this way will not be quite so early as those in frames, but I think they are about as good. There is some danger that those in frames may get too much advanced before the ground is ready to receive them."

It will be seen this is an ingenious and simple method of applying the heat of the sun as "bottom heat." The lower ends of the cuttings being puddled or "grouted," are in a condition to slowly callus during the winter, and when they are exposed to the sun's rays in spring, the roots are induced to push, while the upper ends of the cuttings are further down and beyond the reach of the heat, and the buds kept dormant. The cuttings are, in fact, in just the condition they would be in the cutting bench—the lower ends warmer than the upper portion. This method can no doubt be usefully applied to other cuttings than those of the vine. With many cuttings, time is essential to success, and this can be allowed by this method more economically than in a propagating house.

Notes from the Pines.

Did you ever notice that towns and cities have their horticultural, as well as their architectural features? If asked what were the striking features of New Haven, Conn. I should say, firstly, its elms (of course), secondly, its abundance of well kept grass, and thirdly, the profusion of

Funkias or Day-lilies.

In a visit to the place in the last days of August, we found it all "ablow" with these pleasing flowers. There is so much confusion about Funkias, that one is never sure of a name, but I took this to be, as seen from the street, *Funkia subcordata*, also known as *F. alba*, *F. cordata alba*, *F. grandiflora*, *F. Japonica*, *Hemerocallis Japonica*, and I do not know by how many other names. It makes a mass of fine green foliage with just above it, large racemes of long white flowers, in the greatest abundance. In nearly every yard and garden, wherever there were any flowers, this was quite sure to be seen. There were Funkias in large clumps, Funkias in large masses, Funkias in rows, and more Funkias—and a most pleasing sight it all was.... I wonder if the

Second flowering of Wistaria

has been so general elsewhere as it has been about here. The vines—I refer to the Chinese species—in July and August produced flowers, and in some cases quite profusely. I suppose that a severe frost we had at the time interfered with the spring blooming, and we have it at this late season to keep the general average good.... It is gratifying to find a plant that one has been somewhat enthusiastic over, and has taken some pains to bring into notice when first introduced, stands the test of several years' cultivation, and fully sustains one's first impressions. This has been the case with the

Variegated Eulalia Japonica.

one of the finest of all ornamental grasses. A row some 40 feet long, and the foliage full six feet high is stately as well as handsome, and a large circular bed on the lawn filled with it, elicits many a prolonged O—h! from passers by on the road.

The Zebra-striped Eulalia

in which the markings are singularly cross-wise, we feared would be disappointing from the lack of strong contrast in the colors, small plants being far from striking. Both these varieties of Eulalia are examples of the fact that we have often noticed—that one can not properly form an opinion of the merits of herbaceous plants until they have become thoroughly established, and have made themselves quite at home in their station.... From the comments in the English journals on the

Fruiting of the Japan Quince,

it appears that this is of rare occurrence there. I refer to the brilliant early-flowering shrub generally called *Pyrus Japonica* with us. Having several specimens that bear regularly, and often profusely, I supposed it did so generally. W. C. Strong, of Brighton, Mass., in an article in "Gardeners' Monthly" for July speaks of having 15,000 seedlings of *Pyrus Japonica*, from which we may infer that the plant fruited freely with him. This gentleman wrote the article above mentioned to announce his experiments with the shrub as a new stock for the pear. He found the buds to "take" on it readily, and the growth so pleased him that he proposes to test the stock on the large scale.... Spring-flowering shrubs are abundant enough, but those that bloom in August and later are so few that I am always glad to add to the list.

The Chaste-tree (*Virex Agnus-Castus*)

is very old, but we rarely see it, yet it is very satisfactory with its abundant long spikes of lavender-blue flowers, and its foliage is also pleasing. With me—not far from New York—it is not hardy enough to become a tree, as the winter kills it nearly to the ground, but a dense mass of new growth comes up every season and flowers most abundantly. Another shrub, blooming at the same season, is

Lindley's Buddlea (*Buddleia Lindleyana*),

which gave me a pleasant surprise by proving itself hardy. It is a favorite shrub with P. J. Berckmans, Esq., from whose extensive collection at Augusta,

Ga., it was received. It was taken up and housed for one or two winters, but the old plant, having grown too large, was left out a few years ago, expecting, of course, that it would be the last of it. To our great surprise it bloomed the next fall as freely as ever, and is now (Sept. 1st) full of its gracefully drooping clusters of dark violet colored flowers. This is but one of a number of similar instances in which I have left out plants usually regarded as belonging to the greenhouse, and found them to be hardy.... "The Meadows," as the vast tract of marsh is called, just back of the Palisades, and which is traversed in one direction by the Hackensack River, and in the other by the Erie Railroad, present a great variety of the vegetation common to such localities. Conspicuous among this is the

Swamp Rose Mallow (*Hibiscus Moscheutos*),

forming in places clumps so showy as to attract the notice of persons usually indifferent to such matters. This is the plant which, some 15 years ago, was offered at a round price as "American Jute," and which met the same fate that has befallen many another new "fibre plant." Still it makes a showy plant for the garden, and was 20 years ago much more common in cultivation, as *Hibiscus palustris*, than at present. The large hollyhock-like flowers are six inches or more across, and usually of various shades of rose-color, though sometimes white; I discovered from the cars one with white flowers with a crimson eye, and one of the neighbors found a pure white one, both of which have been promoted to the garden. The California species, *Hibiscus Californicus*, much resembles this in the form of the flower, which has a white corolla with crimson at the base, but the foliage is quite distinct from that of ours. The

Halberd-leaved Rose-Mallow

of more Southern localities (*Hibiscus militaris*) is a fine garden plant; its stems—five feet or more high—are often purplish, its leaves handsomely lobed, and its flesh-colored flower about the size of our common species.... Is there a handsomer fruit than

Clapp's Favorite Pear

when in perfection? Yet it is one of the most unsatisfactory of all pears. A friend who is given to putting things strikingly, says it is one of those pears that have to be "picked by the clock." If left a day or two too long on the tree it will be sure to decay at the core, and if gathered too soon it will not color and is of poor flavor. It is good when one gets it, but the trouble is to get it. After all there is no pear of that season—middle of August—equal to that beautiful little gem of a fruit, "Manning's Elizabeth."

Blackberries in Indiana.

BY STEELE BROTHERS, LA PORTE, IND.

[The Messrs. Steele have given us from time to time, a report on their Blackberries, in the cultivation of which they are extensively engaged. Their experience shows that it is not well to be hasty in deciding on the merits of a fruit; the "Snyder," which at first did poorly with them, they now regard as a valuable market variety.—Eds.]

We fruited six varieties of blackberries this season, and give our experience. First to ripen is

WILSON'S EARLY.—It is the largest and finest looking herry we have seen. Quality poor, but on account of its size and fine appearance, sells readily at a good price. The plant is tender; were it hardy, it would be our most profitable market variety.

THE SNYDER ripens next, and is the hardiest variety we know of. It has only failed to yield a crop once since we have known it. It is very prolific, the berries ranging from small to medium in size; it ranges second as to quality, and the bulk of the crop ripens within 10 days.

THE KITTATINNY begins to ripen soon after the "Snyder," but does not come on so fast. The crop is about three weeks in ripening. Old bushes well cultivated, will yield as many berries as the "Snyder," but being considerably larger, they will measure more bushels. It ranks first in quality, bringing readily from two to three cents

per quart more in our market than the "Snyder." In large cities the difference would be greater.

THE WESTERN TRIUMPH is about the size of the "Snyder," and of first quality; the bushes are thrifty and very productive.

THE MISSOURI MAMMOTH is not quite so prolific as the last named, but the berries are larger and the quality is excellent.

TAYLOR'S PROLIFIC is very sprawling in its habit of growth. The berries are so much like the "Kittatinny" in size, shape, and flavor, that it is very difficult to tell them apart.

We consider all of these last three worthy of a general trial. They appear to be hardy, though we have not tested them long enough to be certain. The conclusion we have reached, is, that the "Snyder" is most profitable for general cultivation with us. It is the hardiest, and while young, the most prolific; plants set this fall or next spring will bear a good many berries in 1880 and nearly a full crop in 1881. While the "Kittatinny" and "Wilson's Early" set at the same time will have very few berries before 1881 and no full crop before 1882. The "Western Triumph" and "Missouri Mammoth" also bear well the second year.

The tops of the "Kittatinny" and "Wilson's Early" do not live through the winter here more than once in two or three years. For this reason, though we shall not discard them, we shall set more largely of the "Snyder," that we may be sure of a crop every year.

THE HOUSEHOLD.

For other Household Items see "Basket" pages.

Home Topics.

BY FAITH ROCHESTER.

Fine Flour and Graham.

I am heartily glad of the modern improvements in grinding wheat, which give us flour as fine and white as the old superfine flour, yet far more nutritious. Good millers assure us that the "new process" flour contains an increase of nearly fifty per cent of the most valuable food constituents of the wheat. Bran is the only portion of the wheat rejected by the new process, contains some important elements for human growth, but many doubt whether these are most easily obtained by making bran an article of diet. Moleschott, a German scientist, investigated this subject carefully, and concluded that the use of unbolted flour had been too strongly urged. He says that only persons of very strong digestive powers, and engaged in active life, can digest the bran and appropriate its nutritive matter. Many find the digestive organs greatly irritated by the bran, "and thus undesirable results attend an abundant supply of substances which, though highly nutritious, are digested with difficulty, or not at all."

The author of "Foods," Dr. Edward Smith, gives a similar opinion. He thinks that the coarse bran not only leaves the body, undigested in most cases, but in its progress brings away much that would otherwise be worked up into bodily nourishment. The action of the bran in cases of constipation is well known—a mechanical action sometimes very useful when too "rich" and concentrated food is used, or where sedentary habits render the bowels inactive. But people of average health, leading moderately active lives, as all children do, and using vegetables and fruits as part of their daily diet, have no need of a steady mixture of bran in their food. It has long seemed to me that the instinctive pleasure most of us have in food of fine texture, as compared with that which feels coarse and rough in the mouth, need not be disregarded in the preparation of so important a thing as bread. So when I use graham flour, which is decidedly branry—such as the northern winter wheat makes—I either sift out the bran, or mix it half and half with white flour. But I avoid the sacks of graham labelled "Best white winter wheat," and either get the new process graham, which has no perceptible

bran, or fresh ground unbolted spring wheat. I am speaking of Minnesota grain.

Why use Graham Flour at all?

Because it adds a pleasing variety to our bill of fare. I should be very sorry to banish graham pudding (or mush), and graham gems and crackers from our table. Besides, I do not doubt that the best graham flour—that which has the bran finely cut to pieces and in small proportion to the rest of the flour—is better for the common use of many people who live mostly on concentrated food, or use much meat, cake, and pastry, than bread made of fine flour. Last year I lived close beside a large flouring mill for a few months. It was a mill using the modern "new process" machinery, and grinding the best of "gilt-edged" as well as "family" flour. When I wanted graham, I sent a sack to the mill, and received into it the pure unbolted wheat-meal before it had undergone any sifting process. I could not ask for better graham flour—made as it was from the best Minnesota *spring* wheat. This, however, was not like what I buy in the city labelled "New Process Graham," though I sometimes get the same labelled "Fresh Ground." I seldom use the highest priced "gilt-edged" fine flour. It makes beautiful loaves, and it may be true, as I am told, that a sack of it goes much further "than the common grade flour," but it seems to empty the pocket-book faster, and a friendly miller, who makes both kinds, has assured me that the "grade" or "family" flour, is just as nutritious as ground wheat can be with the simple bran extracted. Certainly the bran we get now-a-days for our cows, is quite different from what we used to get, years ago. It is so cleanly peeled from the wheat as to appear like very insufficient food for any animal unless mixed with corn-meal or shorts. The old-fashioned bran had clinging to the inside of the husk some of the most nourishing food material of the wheat, so that when this was bolted or sifted away from the white flour, the latter was left poor indeed, and deserved the outcry made against it.

Good Gruel for the Sick.

For the first time in my dozen years of motherhood, I have had a child really sick in bed, and unable to be dressed. All about that sickness I shall not tell here, but the patient and his mother have both learned important lessons. The sickness was partially the result of a degree of accidental poisoning; but we shall hereafter be more careful about the times and seasons and temperatures of the swimming baths, that the body may be found in a better condition to resist disease. I believe, with a host of others, that little boys who get interested in swimming, are liable to do themselves great injury by too frequent and too long-continued visits to the water. There was poison in the system to be got rid of, and Nature tried to rid the stomach of its contents, as one of the first intimations of sickness. She did not succeed, and as there was no warm water in the house to aid Nature's efforts, and I had then no idea of the poisoning, I let the child crawl off to bed with the bad stuff unrejected, and for a day or so, I still supposed that he would soon get about. But he would not eat, and after several days of fasting, I began to feel great anxiety about the return of his appetite. I feared that he would become so reduced in strength that we should have to bring him up on beef-tea and broths. But as the days passed it seemed less dangerous to wait patiently for the return of appetite. He lived on water, drinking it often and plentifully in obedience to his own instinct, and I could see that it, in connection with daily sponge-baths, and enemas, was helping him. One morning he asked me with some eagerness if we couldn't have fresh warm loaves of Boston brown bread brought home from the bakery sometimes next winter! Then I knew that the appetite was coming. A few hours later he wanted to know what arrowroot looked like, and what could be made from it, and thought a little cooked thin with milk and sweetened a very little would taste good. How gladly I prepared it, and fed him the few spoonfuls that satisfied him. Now I believed in my heart, all of the time, that the best food he could have along at first, would be gruel made of sifted graham, and seasoned with

creamy milk, such as seems very delicious to me when I am sick. But the last graham gruel he had tasted, had been made of "branny" unsifted graham, and he "never wanted any more." So I had equipped myself with arrowroot, sago, tapioca, and ground rice, having studied the recipes for the sick in Marion Harland's book, and in a work on domestic medicine, which a neighbor lent me. But there was small demand for these after all. After one or two small meals of these prepared in the most simple manner, beef or chicken broth, with bread or crackers crumbled in, and a dessert of ripe fruit—at first grapes (the first thing he was willing to taste), or an orange, and soon a peach or a ripe apple—gave satisfaction, and as soon as he had tried a little graham gruel, made as I like it best, that alone became his favorite food. I have the water boiling vigorously, and turn into it slowly, stirring rapidly, a thin paste of sifted graham flour and water, having previously salted the water to taste. For a pint of boiling water, I should use a small half teacup of sifted graham, making the gruel quite thick. Into this I pour good sweet milk until thin enough for a rather thick drink, letting this milk scald, but not boil, in the porridge. Then I cool it, thinning again so that it can be drunk, with milk—and call it *good*. So does my patient, and it gratifies me to see how eagerly he takes it. The milk is excellent nourishment, and so is the flour used, and though it would hardly support the strength of a laboring man as a steady diet, it is a useful dish where something light and nourishing is needed, especially for children.

Other Food for Invalids.

Oatmeal gruel made in the same way as that of graham flour, is excellent, only it should be cooked longer and with a less proportion of meal to the same amount of water, as oatmeal swells very much in cooking. Corn-meal gruel is not so useful, because it is more heating and less nourishing. Corn-meal needs a very thorough cooking. Gruel made of fine meal should boil at least half an hour, and it is best when one-third white flour is used with the meal, mixed with cold water before putting into the boiling water. Most of the recipes for the sick which I have found in my late search, seem to me very objectionable, on account of the seasoning. Nearly all of these gruels are sweetened with sugar (wholly unnecessary if you have fresh sweet grain, and much more likely to become sour in the stomach), and it seems to be supposed that to be palatable, food for the sick must be spiced with nutmeg or cinnamon, with the addition of lemon juice or wine, or both, while the old-fashioned dread of milk seems to prevail. Modern physicians are advising milk for weakened invalids. I recently read this testimony from Prof. Gairdner, of Glasgow University. He says: "To give wine, whiskey, and beef tea, while withholding milk, is simply, in my opinion, to destroy your patient. And the more wine and whiskey you give, the more sure you will be to destroy your patient soon, because you are thereby poisoning the blood. I believe that infinite mischief has been done in typhus fever, and in all fevers, by giving wine instead of milk. It is a fatal delusion."—As for the spices, they are often the hardest and last thing that a weak stomach can digest, remaining at the last to heat and worry the stomach that needs rest.

Common Weeds made Ornamental.

Under the above title, we last month described the manner of making large downy balls from the common thistle. After it was too late to make a correction, the lady who kindly gave us the information discovered that in describing the matter from memory, she had made an error as to how much of the prickly green cup, or involucre, should be removed from the thistle head. Instead of leaving as much as shown last month, (fig. 2, p. 343), all of the involucre is to be removed, that can be readily cut away, as none of it is needed. A section of the prepared thistle head, with the involucre removed, and the flowers pulled out, is here given in fig. 1. It was stated that the downy ball consists of the hairs or bristles of the "receptacle" or the

bottom of the cup on which the little flowers stand; this receptacle is really the enlarged, flattened end of the flower stalk, and is indicated by *a*, in the figure; as the hairs are attached to this, all of the green and prickly involucre, may be removed without causing them to fall out. We usually test such matters before giving them to our readers, but in

Fig. 1.—THISTLE.

Fig. 2.—DOWN.

this case we had not time. The best thistle for this use, is the common large flowered species; the tall late thistle found in swampy places, has very short hairs, and will not answer. Another lady has shown us how to convert the

Seed Pod of Milkweed

into a most beautiful ornament. There are a number of species of Milkweed (*Asclepias*), some quite early, and others, especially those growing later in wet places; the pods differ much in size, but they have essentially the same structure, and any of these will answer the purpose. The pods break open when ripe by a slit along the curved side to allow the seeds to escape. Nearly all have noticed

Fig. 3.

the beautiful silky down attached to the seeds, each of which has, as in figure 2, a tuft of the finest hairs to allow it to sail off on the air to some distant resting place. The pods are to be gathered when nearly mature, but before they open, as soon as the seeds are full-grown, even before they begin to brown they will answer. If a seed be examined, it will be found that the hairs are not attached to it singly, but if the tuft be separated it will leave the seed all in one piece, the numerous hairs being stuck together at the end. The pod is to be carefully opened; if it will not split otherwise, a knife may be used to merely cut a slit through it. Within will be found a body like that shown in figure 3, which is slightly united to the pod by each end, and is to be detached. It will be worth while to examine this in order to know what we are working with. A botanist would describe it as the *placenta*, with the attached seeds. The placenta, or seed-bearer, is seen at the lower end, *a*, and at the upper end, *b*, but all the rest is closely covered with the flat seeds and their down, save a narrow line, *c*, extending the whole length. The seeds are laid on with beautiful regularity, and overlap one another like the scales of a fish, while the hairs of the down lie close together to form a sort of flattened thread. In order to succeed, the most careful and delicate handling is required; as soon as the seed-bearer is taken from the pod, the lower end, *a*, is to be tied; a bit of soft cord may be used, or what is better, a very narrow ribbon; this is to

Fig. 4.—MANNER OF MOUNTING.

be tied quite firmly, as the part will shrink in drying. The projecting portion (*b*, fig. 3) at the other

end is to be cut away up to the seeds. In working with this, we found it convenient to contrive some kind of a support in order, as far as possible, to avoid handling. Two very large pins pushed through a bit of thin wood, such as a piece of cigar box, formed a stand upon which the seed-bearer was mounted, as in figure 4, the pins being thrust into the portion (c, fig. 3) not covered by seeds. The next step is to remove the seeds, using the point of a penknife as in sealing a fish, taking care to avoid disturbing the down; most of the seeds will come off with ease, but here and there one may need to be picked off separately. When the seeds are removed, the down will present a beautiful appearance, the closely pressed down resembling, in all but color, the breast of a humming-bird; indeed the arrangement is so regular, and the lustre so exquisite, that a sight of it is worth all the trouble, and one naturally wishes it might be kept in this state. Nothing else is now to be done but to allow the seed-bearer and its attached down to dry. Each tuft of down is overlapped and held by the one next below it, and the last, or lowermost, are tied; each is secured by the end that is, when attached to the seed, uppermost. The natural tendency is to spread, as in figure 2, but one end of each being held by the other tufts, and the hairs being stuck together at the opposite end, each tuft can only spread to form a sort of narrow balloon. As each tuft thus expands, the size of the whole mass will increase wonderfully as it dries; that from a pod of medium size being over two inches through. Should any of the downy tufts stick down and fail to open, they may be gently lifted with a needle or slender knife point. We do not attempt to show the finished affair by an engraving, as it is so delicate that it would be very difficult to do so, and black lines would quite fail to give the lustrous beauty and gossamer lightness of the mass. But the affair is as frail as it is delicate, and will not bear handling; it is best preserved under a glass shade. Such a down-cluster would work in admirably with a design in skeleton leaves, and no doubt many of our tasteful friends will find other uses for such an exquisitely beautiful natural product.

More About Soap-making.

The article in the *American Agriculturist* for July last has called out several letters from our house-keeping friends; many of these are so indefinite as to quantities as to be of little use to inexperienced housekeepers—the only ones needing instruction. The following, by Mrs. G., of Conn., gives the cold method, which is preferred by many. In giving the results of 25 years' experience, she says: "The soap-barrel should be of pine or fir, instead of oak or other hard wood—a fish-barrel, well cleansed, will answer, though the heads of these are not quite thick enough. Put into the barrel five pailfuls of lye, that is strong enough to bear up an egg, and pour to it 28 lbs. of melted and strained grease. Stir it well together, and fill it up gradually with weak lye or water, stirring well as this is added, and stir it daily for a few weeks. It will not be fit to use under three months, although it is of the consistence of nice hard jelly, and looks good enough to eat. It is still better if kept until six months' old. If one prefers to make soap with potash instead of lye, take 20 lbs. of nice white potash, and the same weight of strained grease. Dissolve the potash in 3 or 4 pailfuls of water in the barrel; it may take 2 or 3 days for it all to dissolve; melt the grease and pour to the potash, fill up the barrel with water, and proceed as above directed. Do not use potash soap when new, as it eats the hands badly. The proportions of materials may seem large in the above rules, but strong soap is much more effective in cleansing soiled clothes than the weak, slimy, ill-smelling stuff so often seen, and it will keep good for years. Boiled soap will be fit to use sooner than cold soap, but it is not so nice. The economical farmer's wife should have two soap-barrels, one for the old soap and one for the new, and *never use new soap*. If made of clean materials, and kept closely covered, it is nicer for the finest linen than most of the many kinds of hard soap so much in use, and does not injure the fabric."

"Aunt Peggy" writes a very pleasant letter from Otterville, Mo., in which she says if she "understands anything, it is making soap from ashes." Her instructions for making the lye are useful and explicit, but when she comes to making the soap she "is not particular about the quantity of grease" she uses, and her directions are much less definite. We give her method of managing the leach, or "hopper" as it is called in some parts of the country. She says: "Grease is grease, the world over, and the trouble in soap-making is always with the lye. I first fill the hopper with good strong ashes, that have been well burned, dampening them thoroughly, but not wet enough to drip, and let them stand two or three weeks before the lye is needed. Provide a barrel large enough to hold all the lye the hopper will make; pour water upon the ashes and let the lye run down and fill the barrel. You will find the lye very strong at first, but it will grow gradually weaker until that which comes from the ashes is of not much value. Keep trying the lye in the barrel with an egg; when the egg sinks in the lye, until all is covered but a spot the size of the thumb nail, then it is just right; stop the leach then, whether the barrel is full or not; it will not hurt, but will help the lye to stand awhile."

Household Notes and Queries.

CANNING GREEN CORN.—It having been several times stated in these columns that it was not practicable to can green corn in the family, several have kindly written to show us our mistake, claiming that they have canned it for years. We must still adhere to our original statement, as all those who have sent us an account of their method, do not properly *can* the corn, they merely put it up in jars, *pickled* in Tartaric Acid. This process was described in August last in the "Basket" on p. 287. There is so much testimony in its favor that the process seems worthy of trial.

POISON IN THE BREAD.—Serious cases of lead-poisoning occurring in Taunton, (Eng.) in houses far apart, the attending physician was at loss to account for the trouble, and water, cider, canned fruits, etc., were examined without finding lead. It was at length ascertained that all the families procured their flour at the same mill, and it was found to contain lead in poisonous quantities. An examination showed that large holes in the mill stones had been filled up with lead, which had gradually ground off and the very fine lead had become mixed with the flour, and caused the disease in a serious form.

IVY POISON.—Poisoning by the "Poison Ivy," "Poison-Oak," or in some localities, "Mercury" ("Markery"), the climber botanically known as *Rhus Toxicodendron*, is of such frequent occurrence that there are probably more domestic remedies for it than for any other trouble. The latest we have seen comes from Doct. A. S. Brown, U. S. N., who gives it in the "N. Y. Medical Record." The remedy is *Bromine*, 10 drops of which are dissolved in an ounce of Olive Oil. The mixture is applied to the affected parts three or four times a day—especially on going to bed at night; the oil is to be washed off twice a day with Castile soap. Bromine is a most volatile liquid, escaping through any ordinary stopper, and it will be necessary to have the mixture made by the apothecary as wanted, as it cannot be kept on hand any length of time.

RYE DROP CAKES.—Mix one quart Milk, two beaten Eggs, a lump of Butter as large as an egg, two teaspoonfuls of Cream of Tartar and one of Soda, half a teaspoonful of White Sugar, sufficient Rye-flour to make a stiff batter. Bake in gem-pans.

BOYS & GIRLS' COLUMNS.

Laying in Stores.

Here is autumn with its ripeness, telling us that the season of growth is over, and that the rest of winter will soon follow. Winter brings its work and its pleasures; the Christmas holidays will soon be here, when girls, and

Fig. 1.—FRAME OF CAT-TAIL STEMS.

boys too, will be thinking of presents for the family and friends; then there will be birthdays, for which you will wish some little gift; besides these it is very likely that there may be some fair to which you would like to contribute something. In thinking about presents you will recollect that it is not its cost that makes a gift valuable, and that one worthy of a present would much prefer something you have made yourself to anything you could buy; and you call to mind the many nice little things you could make if you only had the materials to work with, and will regret that you had not thought of it some months ago and provided a stock of things in store. This with most of you will be; if not the last, almost the last month in which you can collect materials to work up hereafter, and we remind you to improve it.

What Shall we Collect?

will be asked by some. That depends in part upon what you would like to use the materials for, and in part upon

Fig. 2.—FRAME OF GRAPE STEMS.

what you can find. A little ingenuity will convert very common materials into really tasteful and useful forms. Very pretty things are made of spruce twigs: they make neat little picture frames, racks for pens, or even for tooth-brushes, and various other articles. The common White or Black Spruce will answer, but it is often easier to get twigs of the Norway Spruce, which is so often planted for ornament. By cutting a twig carefully here

and there, you can get all that you need without disfiguring the tree. The twigs should be laid away with a board or moderate weight on them to keep them flat, and when dry, the leaves will fall off or come off readily. . . . Even the

Stems or Canes of the Grape-Vine

may be used for various purposes. When the vines are pruned this fall, there will be much cut off that is too small for cuttings, but just what you can make use of. Those who have no grape-vines—and we trust they are but very few—can gather the stems of wild vines. Tie the stems in bundles to keep them straight. In collecting the vine stems leave on the tendrils, and as these add to the beauty of work made of this material, it is well to collect a lot of tendrils by themselves to be added in making up. When either these or the spruce twigs are used, they are first to be soaked in hot water until they bend readily, and when shaped as desired, they must be securely fastened until dry, when they will retain the form to which they have been bent. A frame made from vine-stems is given in figure 2; it may be used for a leaf and fern design, or for a picture. It is well to bend the stems after softening them in water around a block of wood, to serve as a mould, or a dish, or some other article of the right shape will answer. In fastening such work, very fine copper wire and pins of various sizes will be found useful.

The Common Cat-tails

of the marshes could be worked into a variety of forms, did they not shed their down and become useless; but the stems of the Cat-tails are long, straight, and light, while they have sufficient strength for some purposes. Figure 1, shows how these stems are used to build a frame; the places where they cross may be bound by fine copper-wire, and this is hidden by small cones, acorn-cups, or other objects. The space between the stems may be backed with some colored paper; and those who know how to make leather-work, can ornament it with leaves of leather. It will be better to use a thin board the whole size of the frame; mount the picture and border of colored paper on this, and build up the frame around it, using pins or brads to fasten the stems to the board. These are merely given as examples of the manner of working up common materials. A frame or bracket of wood may be made a handsome affair by covering it

With Lichens, or "Mosses,"

as they are often wrongly called—what they are, is told by the Doctor in this month's Microscope talk. These are found on tree trunks, old logs, old fences, on rocks, etc., and may be gathered at any season; it is best to collect them on a damp day, as they then are readily removed, and are not brittle as in a dry time. Spread them loosely until dry, and store until wanted for use. To cover a bracket or frame, first assort your lichens, placing each kind and shade of color by itself, as much taste may be shown in the manner of putting them on. Thick floor paste is used, a coat of it being put upon the wood and the lichen laid upon it.

Leaves, Ferns, Grasses, Etc.,

for making up into little pictures, especially autumn leaves, must be gathered soon, or it will be too late. Grasses to be used for this purpose, as well as the leaves, etc., should be pressed. Some large book, not valued, may be used for pressing, or what is better, as we never like to see books put to such uses—soft newspaper folded in several thicknesses, and the leaves, etc., placed between them and a weight placed on top. To keep the color, especially of autumn leaves, a plenty of paper must be used, which for a few days should be changed every day. Keep the leaves, grasses, etc., under pressure, to keep them in proper shape, until you use them.

The Young Microscopist's Club.

In telling you last month some of the points by which you can know a Fern from other plants, I said that the Ferns belonged to the Flowerless Plants, but I find that I did not say so much about these as I intended. In studying natural objects it is necessary to so arrange them as to bring those alike together. In birds the *waders* form one group, the *swimmers* another, the *birds of prey* still another, and so on. In insects the butterflies are put together, as are the beetles, the flies, etc. So in every branch of science the objects are classified. In plants we have two great series into which all plants are divided;

The Flowering and Flowerless Plants,

and whatever plant you find must belong in one or the other of these. These plants have no proper flowers, and they do not have seeds like the flowering plants. In all the plants that we are most familiar with, the flower is followed by seed, each one having within it a minute plant, or the beginning of one, ready formed, and when the seed is sown a plant will come up; this plant is just what was already in the seed, but increased in size. The little plant in the seed is called the *embryo*, but nothing like this is found in the flowerless plants; it is true that they produce something that answers the pur-

pose of seeds—something which after a while will produce a plant; this, as described last month, is a

Minute Dust, Called Spores.

The part which a spore takes in producing a new plant is too difficult for you to understand until you know more about plants than young people are likely to have learned. So you must take it on trust until you get old enough to look into the matter. In the flowering plants some are much simpler in their structure than others, and we find it the same among those that are flowerless. In the Ferns, for example, there are root, a stem, leaves or parts answering to them, and distinct fruit-dots, while others are much simpler until we come to a mere little cell, or bag, or a simple thread that constitutes the whole plant, and grows and reproduces itself, which is all that larger plants do. Related to the Ferns are

The Horse-tails,

one of which was described in Feb'y last as the Field Horse-tail, its spores making a curious object for the Microscope. Another family of flowerless plants is the Mosses. Quite a number of things are commonly called Mosses that do not belong to the family—even sea-weeds are frequently called "Sea-Mosses." The Mosses have a stem, and distinct leaves, and produce their spores in a separate spore-case. In fig. 1 we have a common Moss which gives a general idea of these plants. The spore-case, *a*, is sometimes called the fruit; the botanist's name for it is *Sporangium*. Figure 2 shows the same

Fig. 1-4.—1. A COMMON MOSS.—2. THE SAME VERY YOUNG.—3. A SPORE-CASE WITH HOOD.—4. THE SAME WITH HOOD REMOVED, AND LID C LIFTED, SHOWING THE TEETH, *d*.

moss when young, before the stem has lengthened upwards and lifted up the spore-case, as in figure 1.

The Spore-Case or Sporangium

presents a great variety in form, size, and other points; hence it serves to classify the Mosses into genera. You will find these plants at all seasons of the year, and very pretty objects some of them are for your Microscope. Figure 3 gives the spore-case of another Moss, much magnified, that you may see the parts distinctly. The case is often with a sort of cap or hood, shown at *b*. This is sometimes very small, and being pushed off early, is not always found, and at others large and very noticeable; in describing Mosses this is called the *calyptra*. The case has a lid or cover (*operculum*) which finally drops off to let out the spores; this lid is seen through the hood at *c* in figure 3, while in figure 4 the hood is removed, and the lid *c* lifted off; in most Mosses the mouth of the case bears a sort of fringe, *d*, which consists of a single row of teeth, or in some cases there is another row inside of the first, forming a double fringe; at first these teeth are bent over towards the center to form a sort of inner covering to the mouth of the spore-case, but they are much affected by moisture, and are often found erect as at *d*. (Botanists call this fringe the *peristome*, which means, around the mouth.) One curious thing about it is, that these teeth are always some multiple of 4, and vary from that number up to 64; they are broad and strong, as in the engraving, or are merely slender hairs

Fig. 5.—A FLAT LICHEN, *Stricta*.

which are sometimes twisted together. The teeth are often handsomely marked, and as they are of pleasing colors they make pretty objects for the Microscope.—

Mosses Vary Greatly in Size.

One of the largest of ours, found floating in northern

Fig. 6.—A BRANCHING LICHEN, "TREE-HAIR."

streams, is a foot or so long, with large leaves for a Moss; while others are less than a fourth of an inch in height. The most useful of the Mosses is the common Peat Moss, or *Sphagnum*. This is much used for packing plants and other garden purposes. Of course there are many other things about Mosses that a student of them would wish to know, but what has been said, and the engravings, will, I think, allow you to distinguish a Moss from any other plant. . . . I often hear of mossy fruit trees, moss on old fences, and of moss to cover brackets, and to make other fancy articles, and when I see them I find that

They are Not Mosses at All,

but plants of a very different family, the *Lichens*. There is no other name for these plants as a family, and that is perhaps why they are so often called Mosses.

When you speak the name recollect that the *ch* is hard, and that it is to be pronounced as if spelled *li-ken*. These plants have a great variety of form; some are thin, flat, crumpled plates or sheets; others long and slender, like a small cord; others are erect and vase-shaped, or much branched. They grow on the ground, on stones, boards, trees, etc., and have even been known upon glass in the windows of old buildings. The flat Lichens have sunken spots in the surface, as at *a*, *a*, fig. 5. These are "shields," or fruit-dots, and have imbedded in their substance little sacs containing the spores. The most useful of these flat kinds is the Iceland Moss, used in far northern countries as food. In the deep northern woods the "Tree-hair" (*Usnea*) figure 6, is found hanging from the trees, some of it 4 or 5 feet long; this bears its shields, *a*, *a*, at the ends of its branches. Some beautiful Lichens related to this are found on the Pacific Coast. The so-called "Long Moss" that hangs from the trees in a similar manner in the Southern States, is not a proper Moss, but a flowering plant. A common Northern Lichen is the "Reindeer-moss," which grows upon the ground and is the chief food of the reindeer during winter. One of the kinds you will be likely to notice is sometimes called "Coral Moss," and has the form shown in fig. 7; the knobs on the edge of the vase are the fruit shields which

Fig. 7.—CORAL LICHEN.

Fig. 8.—MOULD.

are of a Brilliant Scarlet Color and very ornamental. The Lichens present various colors, and some, not showy in themselves, may be so treated as to produce a fine dye. . . . "T. G." Bergen Co., N. J., upon taking a pair of shoes from a closet, found light colored spots on them; some of these spots were as large as the end of a pencil, and others an inch or more across. He examined the spots with his Microscope, and sends a sketch, figure 8, of what he saw, and of course wishes to know what it is. His shoes were simply mouldy, and the spots were the common mould, the same

Fig. 9.—MOULD.

that is found upon stale bread and many other articles. This is one of the objects just beyond the power of our Microscope to show satisfactorily. Some of this mould, carefully scraped off and examined with a strong compound Microscope, would appear as in figure 9. The threads at the bottom are the proper plant, and the little bead like clusters are the spore-eases.... Here is a question that I find it difficult to answer—"G. C. W., Minn., asks "can an insect

Feel Pain after its Head is Off"

As insects have no means of expressing their opinion on this subject, we should give them the benefit of the doubt, especially as they have no distinct brain, but a number of brains, or nerve-centers in various parts of the body. It is best to kill them first. All but those with scaly wings—butterflies and moths—are easily killed by dropping them into alcohol; the others may be killed by placing a few drops of chloroform or benzine upon them.

A Crazy Cushion is now very popular among young people. The idea is to combine the work of various persons in one piece of embroidery—to make a sort of worsted album as it were, (not the only kind of album, by the way, that is a *crueful* affair.) A square of canvas is required: this is then divided in the manner shown in

the engraving—an inner square, and an outer one, with the space, or border, between the two squares, laid off in such divisions as the diagram shows, these lines being worked in black worsted. The owner invites her or his friends to work some design, either in one of the divisions of the border, or in the central square, each one choosing a device without reference to any of the others; when a figure is worked in the central square it is not with the regularity shown in the sketch. The more unlike and irregular the different designs, the truer to its name—the more "crazy"—the cushion will be. When the figures are all worked, the filling in is done with any color that may be desired, and the affair is made up as a sofa cushion or pillow. Worsted work is usually regarded as belonging to girls, but when we said above "her or his friends" we had in mind the fact that we have known young men to have crazy cushions, though so far as we have seen, the designs worked upon them is done by the girls. The idea is a rather pleasant one, and when finished, the work is useful as well as pleasing.

Aunt Sue's Chats.

GUM UPON STAMPS.—MINNIE.—The "gum" upon the back of Postage Stamps is not Gum Arabic, but a substance called *Dextrine*, which is prepared from starch—usually from potato starch. If you mix starch with cold water, it will soon all settle, as it does not dissolve at all in cold water. If starch is carefully heated to 450°, and kept at that temperature for half an hour, it will be changed to dextrine, which differs from starch in several particulars, especially in dissolving in cold water. Dextrine prepared in this way is slightly brownish; if the starch is wet with a very weak nitric acid, and dried, it is changed to dextrine at a much lower temperature than when prepared by heat alone, and is as white as the starch from which it was made.

PRINTING POSTAGE STAMPS.—These are printed in a very different manner from ordinary printing. The stamp is engraved on a flat plate of copper or steel. If you examine a stamp with your Microscope or other magnifier, you will see that the engraving is all in lines. These lines are cut in the plate of metal, 200 stamps being engraved on a single plate. The plate is rubbed over with ink, and then carefully wiped off. The ink stays in the lines cut in the plate, while all the rest is wiped off, and when a piece of paper is laid over the plate, and both passed through a strong press, the paper

takes up the ink from these lines. After the colors on the sheets are dried, they are sent into another room to be gummed. After having been again dried they are put between sheets of pasteboard and pressed in hydraulic presses capable of applying a weight of many tons. A girl then cuts each sheet of two hundred in half, with a pair of shears. They are then perforated with the rows of holes to allow them to be torn apart easily. If a single stamp is mutilated, the whole sheet of one hundred is burned. About five hundred thousand are burned every week from this cause. During the process of manufacturing, the sheets are counted eleven times.

"THE CASTLE OF CHILLON."—EVANGELINE.—This castle is situated near the eastern extremity of the lake of Geneva, in Switzerland. It is on a rock surrounded by deep water, and connected with the mainland by a wooden bridge. It is said to have been built in 1120. For many years it was a State Prison. Byron's "Prisoner of Chillon" has rendered it famous. Bonivard, prior of St. Victor, was confined here from 1530 to 1536. It is now used as an arsenal.

HATTIE E. M.—In a "magic square" every column, horizontal, perpendicular, and diagonal, must foot up to the same amount.

P. R. W. will find directions for a "card receiver" (to hang on the wall) in the March Number of the *American Agriculturist*, 1877, page 107.

"JOE LIVINGSTON" sends the following problem. It is not difficult, but as some of you may like to practice your algebra upon it I give it place. "Twelve persons buy a dinner for \$12. The men pay \$2 each for their dinner, the women pay 50c. each for their dinner, the children pay 25c. each for their dinner. Query: How many men, how many women, and how many children were there?"

Below, we give one a little more complicated:

Two friends set out one day to walk,
A had some miles the start;
A took five steps while B took four,
A was so spry and smart.
But A's spry steps were also short,
Three equalled two of B's;
So when B travelled thirty miles,
He'd gained the space with ease.
This is the problem now to solve,
By arithmetic art;
When A and B set out to walk,
How far were they apart.

Thanks for puzzles, letters, etc., to H. E. M., M. Arrowsmith, C. B. R. (the second, only, who answers S. W. W.'s numerical enigma), T. A. C., Amy F., Evangeline, S. T. T., John J. C., and E. W. E.

Aunt Sue's Puzzle-Box.

NUMERICAL ENIGMA.

I am composed of 41 letters:

My 8, 20, 2, 17, 12, 13, 36, 22, is a number.
My 24, 35, 14, 37, 30, 11, 26, is severe.
My 14, 35, 28, 30, means "before."
My 12, 24, 28, 39, 31, is a sylvan god.
My 18, 30, 13, 32, 10, 21, is a small animal.
My 23, 27, 34, 33, is an article of clothing.
My 9, 6, 41, 4, 22, is often used in hunting.
My 23, 19, 40, 8, is what a certain bird does.
My 33, 25, 26, 4, is very useful in cooking.
My 36, 3, 28, is a kind of fruit.
My 5, 16, 15, is liked by most children.
My 23, 20, 8, is a kind of dwelling.
My 1, 7, 37, is a mark.
My whole is a well-known proverb.

WALTER SIMPERS.

ANAGRAMMATICAL SQUARE WORD.

From the sentence "Sweet nuns soon won," make four words of four letters each, that may be so arranged as to form a square word:

Substitutions.

(To fill the second blank, change one letter of the word that fills the first blank—e. g., I saw a — fly from the — of the hill.—*Crow, brown.*)

1. — asked the — to bring him a glass of water.
2. She spilled some — on to her — dress.
3. He saw a — key lying in the —.
4. I am going to — a row on the —.
5. Is it — that that is a maple —?
6. The poor — floundered into the — and could not get out.

CONCEALED NAMES.

1. Madam, you are losing your veil.
2. Do you remember that event?
3. Yes, indeed, it was well ended.
4. That man had a noble presence.
5. Aye, he made liars tremble.
6. Every word he spoke, told!
7. Yes, there is no man like him.
8. Pshaw! I have met them many a time.
9. Oh! do raise that window.
10. In France, silks may be bought cheap.

PL.

Tashy soulertonis moldes desep lewl.

CONCEALED MAGAZINES AND PAPERS.

1. We must look to posterity for redress.
2. Mamma has sold her Alderney cow.
3. Time slips away very quickly when one is happy.
4. Be careful never to oppress the poor.
5. The cat is under the table.
6. This is a char, perhaps you will like it. E. P. B.

CROSS-WORD.

My first is in Kingdom but not in State,
My next is in monserap but not in bait,
My third is in mourning but not in gloom,
My fourth is in sepulchre but not in tomb,
My fifth is in charcoal but not in wood,
My sixth is in handsome but not in good,
My seventh is in ribbon but not in tape,
My eighth is in satin but not in erape,
My ninth is in grouse but not in real,
My tenth is in shuffle but not in deal,
My eleventh is in sovereign but not in king,
My twelfth is in jerk but not in fling,
My thirteenth is in dungeon but not in jail,
My fourteenth is in whirlwind but not in gale,
My fifteenth is in science but not in art,
My sixteenth is in carriage but not in cart:
If the letters are put in proper place
A Shakespearian character you may trace.

RHOMBIC PUZZLE.

Across.

1. Sometimes a confirmation. Sometimes a prayer.
2. Level.
3. Certain animals.
4. To close.

3. A woman's name.
4. The life of a newspaper.
5. A trap.
6. An adverb.
7. This makes ale a light color.

SCIENTIFIC ACROSTIC.

The initials name part of the atmosphere. The finals include all the metals.

1. A salt which is spontaneously generated in the earth.
2. The characteristic designation of certain microscopic bodies.
3. A crystalline mineral occurring usually in prisms and valued for its polarizing qualities.
4. A metal whose salts are rose-colored.
5. Is the natural state of most metals.
6. Was formerly used for finding the altitude of the sun.
7. A fungoid vegetable production extensively used in medicine.
8. Certain forms of ammonia are thus called. J. A. B.

ABBREVIATIONS.

1. Behead and curtail a color and leave a resinous substance.
2. Behead and curtail a small animal and leave a number.
3. Behead and curtail a basket and leave a small animal.
4. Behead and curtail a plaintive poem and leave part of the body.
5. Behead and curtail a small fruit and leave a quick, smart blow.

ANAGRAMS.

1. Try a thin plum.
2. Find no gruel.
3. Mrs. Nip on time.
4. Entice gallery.
5. So pour music.
6. O see sober rig.
7. In sad cool set.
8. O wise marc.
9. Eject a Saul.
10. Coined beside.

Correspondents will save time, if they will address their letters (to Aunt Sue) to Rowayton, Fairfield Co., Conn., from July to December of this year. But please remember that AUNT SUE is not *Orange Judd Co.*; the latter must be addressed at 245 Broadway, N. Y. City.

The Green Turtle and How It is Caught.

Master Charles S. H., of Neb., and others, who have heard about the Green Turtle, would like to know how it differs from the turtles they have caught, and other matters concerning it. As it is rarely to be seen very far inland, and then only in large cities, no doubt some account of it will interest many. The tortoises and turtles all agree in having the soft parts of their bodies covered by shells; the upper shell is really the flattened ribs, while the lower corresponds to the breast bone in other animals. They reproduce their young from eggs, which they lay in holes in the ground, leaving them to be hatched without their care. Naturalists divide these animals into groups or families, according to certain differences which fit them for various modes of life. One of these families, called *Chelonians* (from the Greek word for turtle), includes those that live in the sea; as these rarely leave the water except to lay their eggs, they are quite different in several respects from those that live on land, or in the rivers. Their feet, or flippers, and

CATCHING TURTLES ON THE COAST OF FLORIDA.

other parts, are well adapted to the "sea-faring life" they lead, and though they move rapidly in the water, they are exceedingly clumsy, indeed almost helpless on land. There are a number of these Sea Turtles besides the one called Green, some of them growing to an enormous size; some live on other animals, while others, like the Green Turtle, feed solely upon plants. The smaller engraving will give you the appearance of this turtle, which varies in size from a few pounds in weight up to 300 to 500 lbs. or more. The under part of this turtle is white, while the upper part is usually a light brown; the name "Green" is said to be from the color of the fat, rather than from that of the animal itself. These turtles are generally to be found in the markets of sea-board cities, where they are kept in tanks of salt water, and fed upon cabbage-leaves and other vegetables. The Green Turtle belongs to the waters of the warmer parts of this Continent; it is especially abundant in the West Indies, and on the coast of Florida; now and then one has been taken in the waters of New York Bay, but such have only strayed or drifted from home. The flesh of this turtle is by many much esteemed as food, but it is chiefly used to make Green Turtle Soup. The turtles are generally caught when they go on shore to lay their eggs, though they are sometimes taken at sea; we have seen the great fellows fast asleep on the surface, and when waked up by the approach of the steamer, get out

of the way in a lively manner; when sleeping thus, they are easily caught in a net. The large engraving, given above, shows how the turtle-hunters catch them, it being a scene taken on the coast of Florida. The turtles leave the water on moonlight nights, and

a soft parchment-like shell, with a little dent at one side; they are about the same weight as a hen's egg, and are highly esteemed as food. Though the turtle neglects her eggs, she is very careful in covering them, patting the sand down upon them with her flippers and then

bringing the weight of her body down over the spot. Though very shy when they first leave the water, when they get fairly at work at their nests they do not care for the presence of strangers. Then is the hunters' time; they can go directly up to the turtles without disturbing them, turn them upon their backs, and they are caught. When thrown upon its back this turtle is unable to turn over; the poor creature is quite helpless, and must remain until it is carried off. It requires some skill to turn over a large turtle, as the animal makes a great struggle, and if one is a new hand at it, he is very likely to be bruised by blows from the powerful flippers, or be blinded by the showers of sand that are thrown up in the struggle. The turtle-hunters have pens placed where the tide will flow into them, where they keep great numbers until they have a chance to send them to market. A great many are sent to Europe. The turtle that furnishes

THE GREEN TURTLE.

after carefully looking to see that there is no danger, slowly crawl about to find a proper place; they then, by working with their hind flippers, make a hole in the sand about two feet across, and each deposits about 200 eggs. Their eggs, like those of our land-tortoises, have

the beautiful shell of which combs and ornamental articles are made, is found in the Pacific and Indian Oceans. The great Loggerhead Turtle is sometimes found as far north as Virginia; when full-grown it weighs 1,500 to 1,600 lbs., but is of little use except for the oil it yields.

"CANDEE" PURE GUM RUBBER BOOTS.

Being free from adulterative mixtures, they give longer service than common Rubber Boots. Their great popularity has led to many cheap imitations having a *Dull Finish*, but this season the **Candee Co.** will **varnish** their Pure Gum Boots, distinguishing them from their common Boots by the label in raised Rubber letters on the leg, "Pure Gum."

The varnish protects the Rubber from the ammonia in manures.

These Boots have the "Candee" Patent **Heel Irons**, which prevent the heels wearing down so quickly.

They also have the "Candee" patent **Outside Straps**, which are more convenient and durable than the flimsy inside web straps.

Other brands of Rubber Boots cost the dealers a trifle less than Candee—but if you insist on having the "Candee" Boot, you will get your full money's worth.

LOOK WELL TO YOUR

HORSE'S FEET.

This drawing shows how many horses are made lame and permanently injured by the use of the *cold-cut and sheared pointed* nails. This process of manufacture produces lamination, causing the iron to form in layers, and when driven into the foot the horny fibres of which the hoof is composed cause the nail to separate at the point, and one portion passes into the foot.

It requires but little observation and reflection, one would think, to arrive at the conclusion as to the kind of nails to be used, whether a mangled piece of iron, rendered DANGEROUS by the *Cold-Rolling and Shearing* process, and liable to silver in driving, thus,

or one made from the rod at a welding heat, where all the fibres remain intact, and a perfect *oneness* maintained, and which being pointed by the hammer renders such an accident as silencing utterly impossible.

"The Hot-forging process is the only sure manner of making a true driving and safe nail."

REV. W. H. H. MURRAY,
Golden Rule, October 31, 1877."

"After long usage, can safely recommend to all owners of track and light-harness horses your *Hot-Forged Horse Shoe Nails*. I consider all sheared nails unsafe for shoeing. Respectfully yours, BUDD DOBLE."

The only **Hot-Drawn and Hammer-Pointed Horse-Shoe Nail in the World**

that is not cut, clipped, or sheared upon the point, and will not split in driving, is made by the

H.W. JOHNS' LIQUID PAINTS.

These Paints are in every respect strictly first-class, and second to no others ever produced in purity, richness and permanency of color, and beauty of finish. They are prepared ready for the brush in sixteen newest shades and standard colors, suitable for the tasteful decoration of dwellings and all classes of buildings, inside and out, and for all purposes where a perfect protective coating is required, and, covering body and durability considered, they are twenty-five per cent cheaper than the best White Lead or any other kind of paint now in use.

The Contract for Supplying Paints for the Metropolitan Elevated Railroad of New York City was awarded to us. This is the largest contract ever made for painting any single structure in this country.

ASBESTOS ROOF PAINT.—Brown and gray and buff, for tin and shingle roofs, iron work, agricultural implements, fences, out-buildings, &c. We guarantee this to be a better article than has ever before been offered to the public for similar purposes.

The largest area of tin roof in the world (the Permanent Exhibition Building at Philadelphia), which was in very leaky condition, has been painted and restored with this Paint where all others had failed.

ASBESTOS FIRE-PROOF PAINT.—White or light tints; for the protection of inside work of factories, bridges, boiler rooms, and other wooden structures in danger of ignition from sparks, cinders, or flames.

Nearly five acres of wood work in the two immense dry goods stores of Messrs. A. T. Stewart & Co., of New York City, are protected with this paint.

ASBESTOS ROOFING with WHITE FIRE-PROOF COATING. For steep or flat roofs, the handsomest, coolest, most durable, and only reliable portable Roofing made. Easily applied by any one. Costs only half as much as tin.

ASBESTOS STEAM PIPE AND BOILER COVERINGS. The most durable, effective, and economical appliances known for preventing Radiation of Heat; will save from 25 to 40 per cent of fuel.

Asbestos Steam Packing, Fire and Water-Proof Sheathings, Coatings, Cements, &c.

All these materials are prepared ready for use, are suitable for all climates, and can be easily applied by any one. Liberal inducements to Local Salesmen, General Merchants, and Large Consumers.

N. P. BROOKS,
Bricksburg Nurseries, Bricksburg, N. J.

CRESCENT SEEDLING STRAWBERRIES.

Parmless Crescent Seedling stands without a rival. This is the third successive season this berry has produced fifteen thousand quarts per acre of fruit that readily sells in advance of Wilson, from two cents to eight, and always in demand. Single dozen plants sold in spring of '77, this season, has produced from one to two hundred quarts. In one case twenty-five plants produced four hundred quarts. Always be sure and get the genuine stock, as there are ten thousand spurious in circulation where there is one hundred genuine.

H. H. SMITH, West Haven, Ct.

FALL E. P. ROE AN "A. 1" REVOLVER FOR \$2.50.

Is by far the best time to set out **RASPBERRY, CURRANT, GOOSEBERRY, and BLACKBERRY PLANTS.** Has a very fine and varied stock, true to name. Send for Catalogue. Address **E. P. ROE,** Cornwall-on-Hudson.

THE ALEXIS (Russian Model).

It is the most extraordinary bargain ever offered in the Gun line. Full nickel silver plate, 7 shot, self-revolving cylinder; wgt., 13 oz., using extra long Rifle Cartridges, and will kill at 100 yards.

These Revolvers were made by the largest manufacturer in the United States for a leading firm in Russia, and were part of the largest contract ever placed in this country for Fire-Arms. They cost over \$5 apiece to make, and the engraving on each one is worth \$2.00. We have bought at forced sale the entire lot for less than the stock alone cost. They are made on honor, the engraving is the finest ever seen in this country, and the workmanship is equal to a Colt's, which it equals in every respect. The stocks are **Ebony**, the most expensive wood that could be used. The metal is *finest English steel*, the barrel being octagonal and superbly rifled its entire length; the cylinder is fluted, as shown in cut. The shape of this Revolver is what is called the **New Russian Model** (similar to Smith & Wesson, 38 calibre, N. M.), giving a firm grip in the hand, preventing the Revolver's throwing up, and producing elegant shooting at long range. This Revolver weighs 13 oz., having an extra heavy and very long barrel, greatly enhancing its value as a target pistol. We guarantee more than satisfaction in every instance, and a better Revolver than \$10 will buy elsewhere, and we will refund the money in every instance where our representation is at fault. Every one should own a good Revolver, and this opportunity will never occur again. We will send this Revolver C. O. D., with privilege of examination at the express office, to any point east of the Mississippi River on receipt of \$1, which will be deducted from the bill; or we will, when the cash in full comes with order, give free a box of extra long target cartridges. (The fact that this Revolver uses the extra long Rifle cartridge makes it doubly valuable, and places it far ahead of all similar ones in the market.) We will send it by mail to any address for 20 cents extra; if sent by mail cash in full must accompany order; we cannot send C. O. D. by mail, neither can cartridges be sent by mail. A complete set of cleaning tools go with each Revolver, and they are packed in an elegant box. Prices of Alexis Revolver, as described above, with **EBONY** stock, \$2.50; with an elegantly engraved Rubber stock (same as on Smith & Wesson), \$3; with a fine \$2 Ivory stock, \$3.75; or with an elegant \$3 Pearl stock, \$4.50. The last Revolver will compare with any \$15 Revolver in the world, and for presentation would make an elegant and beautiful gift. We know that this Revolver is all that we claim for it, and is the biggest bargain we will ever offer. Those who bought our Rob Roy last Spring will have no hesitation in purchasing the Alexis, for big a bargain as the Rob Roy was, this Revolver is far ahead of it. The parts of this Revolver are interchangeable and readily duplicated. Address, **Bay State Arms Co., dealers in Fire-Arms, Sporting and Military, 93 Water Street, Boston, Mass.** Parties in vicinity of New York can see this Revolver at Editorial rooms of the *American Farmer*, 31 Astor House. Preserve this advertisement.

To Improve the Quality of an Article Enhances Its Value.

Indicating the monetary loss from using any salt but Ashton's in dairies, a correspondent writes that "the losses to the butter makers in his county would have furnished them salt and paid their State and County Taxes."—To use Ashton's Factory Filled Salt in making butter or cheese imparts a fine flavor which improves its quality, and the product commands a higher price than it otherwise would; consequently, its use really puts money in the purse of every dairyman (large or small) who uses it. Butter salted with Ashton's is enhanced in value \$2 to \$5 per hundred pounds, at an extra cost of not to exceed 1 1/2 cent to 3 cents for salt, and cheese is increased in value 50 cents to \$1 per hundred pounds, at a cost not exceeding 1 1/2 cent for salt over the lowest priced salt used in the Dairy. In fact, there is no investment that pays the butter and cheese maker so well as the purchase of Ashton's Factory Filled Salt. It may now be had of reputable dealers everywhere, in sacks of 56 pounds each, as well as in the large sacks of 224 pounds each. If not obtainable of your dealers, address

FRANCIS D. MOULTON & CO., Sole Agents, 105 Water St., New York.

IMPROVED BALDWIN'S AMERICAN FODDER CUTTER.

The Simplest
and Best in
the world.
Has only three
feed gears.
Prices greatly
reduced.

Cuts all kinds of
fodder, hay straw,
and corn stalks with
ease and rapidity.
Each machine cuts
four lengths, and is self-feed-
ing. Can be fed light or
heavy, as desired.—Nine sizes,
for hand or power.

The side cut represents
our Power Cutter with the
Safety Fly-wheel, by which
perfect safety is secured to the
machine while in rapid motion,
and also to the operator.

It is the only practical safety
fly-wheel in the market, as it
is governed by palls and
ratchet, and not by friction.
The editor of the *Agriculturist*
said, in September number of
last year: "We have used this
machine satisfactorily." * * The
largest size with power will
cut two tons of fodder an hour.
The smallest size hand-power
cuts 110 lbs. in an hour.

Send for illustrated circulars
giving full description and
prices. Liberal discounts to
responsible parties who will
act as agents.

C. PIERPONT & CO., Manufacturers,
NEW HAVEN, CONN.

ANIMAL MEAL

For Fowls and Swine.

Made from Fresh Meat, Fresh Bones, and parched and carbonized grains, all reduced to a fine, sweet, highly nutritious meal. Fowls and Swine eat it greedily, and it is so concentrated, that four to eight quarts is a sufficient quantity to mix with a bushel of common meal or other food, and the mixture is fed as you would ordinarily feed common meal. It will make your Hens lay and Pigs grow, the meat and parched grains being very stimulating and healthful, while the lime of the bone is essential for forming the shell of the egg or new bone in the growing pigs. It has been extensively used for five years. Trial Bags, containing 30 lbs., \$1. 100 lbs., \$3. Special Price per ton.—Also for sale Ground Oyster Shells, Chicken Bone, Cattle Bone, Ground Scraps, Wheat Screenings, and a full line of Special Feeds for Poultry, Swine, and Cattle. Send for Price Lists and Circulars, giving full particulars, mailed free.

Delivered to any R. R. Station in the U. S. or Canada, free of charge, on receipt of \$10.00.

Address NATIONAL WIRE MATTRESS CO., New Britain, Conn.

Allen's New American Farm Book...\$2.50

Allen's American Farm Book, (the former edition of the present volume), has been one of the standard farmers' hand-books for twenty years; it is still a valuable book, but as its author, Mr. R. L. Allen, could not give time to its revision, this was undertaken by his brother, Hon. Lewis F. Allen, the distinguished farmer of Erie county, editor of the American Shorthorn Herd-Book. The present edition of the work is greatly enlarged, and full of suggestions from the rich experience of its editor and reviser, and is called the NEW AMERICAN FARM BOOK. Originally by RICHARD L. ALLEN, Revised and greatly enlarged by LEWIS F. ALLEN. Cloth, 12mo.

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

OSCAR W. YOUNG, Importer,

No. 60 4th St., Brooklyn, E. D., N. Y.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from p. 369.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

"Mexican Tomato."—"M., Ag'l College, Texas, forwards the flowers and upper leaves only of a plant from seeds sent by the Ag'l Dept. at Washington, as "Mexican Tomato." It is evidently, as he suggests, not a proper Tomato, but some species of *Physalis*—which one we can not say without the fruit. The Mexicans use, under the name of *Tomatilla* (little Tomato), the fruit of several kinds of *Physalis*, and we cultivate one as the "Strawberry Tomato," or "Winter Cherry." Please send the fruit when ripe.

Spiraea Palmata Elegans.—Last year the English and French journals were enthusiastically praising a plant with the above name, concerning which was made the remarkable statement that it was a hybrid between *Spiraea palmata* and *Astilbe Japonica*. We doubted the possibility of such a hybrid, and the colored plates indicated no greater difference from *S. palmata* than often occurs in sports. Having arranged to get this remarkable production—remarkable in the claims made for it—we were not a little surprised, to read in "The Garden" that "It is simply good for nothing, and the least ornamental of all *Spiraeas*."—Why can't plants grow like the highly-colored pictures, or the still more highly-colored descriptions which those who have them for sale give us in advance?

How Lime is Applied.—"C. S., Jackson Co., Ohio. Lime is usually applied by spreading it dry slacked upon the surface—40 or 50 bushels per acre—and mixing it with the soil by harrowing. It is best spread from a wagon by means of a long handled shovel.

Treatment of a Curb.—"A. J. S., Jefferson Co., Ohio.—A curb is a swelling just below the hock on the back of the leg, and is caused by a sprain of the posterior ligament of the hock. At first more or less lameness results from it. After the tenderness is past, the lameness disappears, but the swelling remains. After a time the soft swelling develops into a hard callus, which is difficult of removal. To treat the soft swelling, take 1 dram of powdered iodide of potassium and dissolve in 7 drams of glycerine, adding a little water if necessary to make it dissolve. Rub this upon the curbs for 10 minutes every day until the swellings disappear or become hard, when blistering should be resorted to under the advice of a veterinary surgeon. "Dadd's Modern Horse Doctor" is a useful book, and every owner of a horse should have a copy of this, or of Prof. James Law's "Veterinary Adviser."

Apple Pomace.—"A. E. E., Worcester, Mass. By composting with lime (5 bushels to the cord) apple pomace will be decomposed and made into good manure in three to six months' time. The lime neutralizes the acid and aids decomposition. The material contains considerable potash and phosphoric acid in the seeds, as well as some nitrogen.

Five Hundred Dollars is too small a capital on which to begin milk farming near New York. So we would advise "P. B.," who "would have to rent a farm, buy a horse and wagon, and feed the first year," not to try it, as the experiment must end in failure and loss. Many people suppose that farming can be carried on profitably without either capital or experience. While this may be possible to a certain extent on new lands, which cost almost nothing, the idea, as a general thing, is wrong, and has caused much loss and many disappointed hopes. One of the chief obstacles to success with the majority of farmers is the lack of working capital. In England, every farmer must have from \$25 to \$50 per acre, while here his working capital is too often represented by a debt in the form of a large mortgage

Ground Feed for Cows.—"T. N. S." In practice, we find a good ground feed for cows to be the following: 1 bushel each of corn and oats, and 100 lbs. of wheat middlings ground together. Although it costs something to grind the middlings with the grain, yet the better quality of the feed and its finer condition, when thus prepared, repay the expense. If otherwise considered, the middlings may be mixed with the meal, by shovelling them together on the barn-floor.

Some Poultry Matters.—"A. G. O. M." The common mixed or mongrel race of fowls known as barn-yard or dunghill fowls, are susceptible of improvement either by careful breeding and high feeding, or by crossing with pure bred cocks. An average half-bred B. Leg horn is better than an average common hen; the cross of pure Leghorn blood is an improvement; the Light Brahma cross gives size of body as well as prolificness of eggs. Light Brahmas are probably the heaviest birds, cocks of 16 lbs., and hens of 12 lbs. being not uncommon. The Dark Brahmas are a fine race, but for some good reasons are not so popular as the Light Brahmas. One good reason is, they are not so hardy or productive.

Salt in a Compost.—Let "C. G. C." try it, and he will learn a good lesson in chemistry. What do we use salt on fresh meat for? Simply to prevent decomposition, and it will have the same effect if put into a compost, which is just the opposite to what is desired. If a good compost is wanted, do not put salt into it, "for the sake of saving the ammonia," as, in fact, it will prevent it from being formed; but spread an inch or so of fresh loam over the heap, which will not prevent decomposition, yet will catch and save the escaping ammonia.

"The National Agricultural Congress" met at New Haven, Conn., on Aug. 27th last, for a three days' session. Whether the death of the President, the Hon. W. C. Flagg, had a disheartening effect, or the meeting was not properly advertised, the attendance was altogether too small to be called "national," or even a "congress," though the few that were present were from widely separated parts of the country. The Secretary, always the most important officer on such occasions, failed to appear, or to say that he could not come. The President was Dr. T. P. Jones, Commissioner of Agriculture of Georgia, and Dr. E. L. Sturtevant served as Secretary. The meeting brought together gentlemen from widely separated points, and, as often happens in such cases, its most useful work was done outside of the meetings in the informal conversations and discussions among the members. We could not see that in the papers presented, or the discussions which followed, the proceedings rose above the level of the average farmers' club. There was the same putting of irrelevant questions, and while the private axe was not conspicuous, a glimpse could be now and then had of the end of the handle. The local committee, while they deserve much credit for making matters pleasant to those who were there, might, it seems to us, have secured a larger attendance by the farmers of New England, and especially of Connecticut. If those present did not increase their knowledge of agricultural affairs, they saw one of the most beautiful of New England cities in its best dress.

Apples from North Carolina.—S. T. Kelsey, Highlands, Macon Co., N. C., sent us a basket of "Carolina Red June" apples, picked from his orchard, Aug. 29th, at which date they had been highly colored for four weeks. These specimens were of the darkest, most intense red, and being of much finer flavor than we have ever known in those raised at the North, gave us an idea of what this excellent early apple can be, when grown in perfection among the mountains of North Carolina.

A Sizable Plum.—Messrs. G. H. and J. W. Hall, So. Glastonbury, Conn., sent us a plum "of the average size," borne by the tree. This plum averages 3 by 2½ inches—not in circumference, but in diameter. The Messrs. H. bought the tree several years ago as a "Pond's Seedling," but the fruit is very different from that, and, as it has not been recognized as a known variety by any of our experts, they propose to call it the "Glastonbury." We suggested to Messrs. H. that this might be a possible instance of bud variation; a single bud upon a Pond's Seedling having sported a view they are disposed to adopt. It is no more strange that a single bud upon a tree should sport in the way of bearing enormous fruit, than it is that a peach bud should sport to produce a nectarine, or the reverse, both having occurred.

Salt of no Value (?) to Animals.—"C. B.," of Hightstown, N. J., writes that his experience teaches that cattle and horses do quite as well without salt as with it. The experience of thousands of others furnishes evidence to the contrary. And even if it were of no special value, it would seem to be a liberal policy to allow animals a taste of salt, now and then, as they relish it so much, and it costs so little. That the desire for

salt is not acquired by domestication is shown by the fact that wild animals frequent "salt-licks" in great numbers, and make long journeys to reach them, indicating that it is a necessity; and it is doubtless a preventive of disease and promotive of digestion.

Salt on Land.—"C. B. M.," Madison, N. J. It is unnecessary to apply salt as plant-food, enough being present in the land, generally, to supply all the demands of the plant. The chief action of salt is to render available the plant-food already in the soil, which was before inaccessible, and it may be beneficial on a soil rich in such constituents, as, for example, a strong clay loam. On the poorer class of soils it may, in the end, be positively detrimental.

A Cow in Bad Condition.—"J. F. G.," Binghamton, N. Y. After having had the teats cut to ease the milking, or after a case of garget, cow-pock, or injury by careless use of milking tubes, a cow would have poor chance of escaping trouble with her next calf. We suggest careful watching when her time approaches; and on the first appearance of heat or hardness in the udder, to draw the milk, and to foment and rub it with a mixture of 7 parts of glycerine and one of iodine, to avoid the use of rich food, and to give an ounce of salt-petre, repeated, if necessary, to reduce fever.

Blood Spavin and Thoroughpin.—"R.," Benton Harbor, Mich. A thoroughpin is a bog spavin which, when the swelling is pressed upon, passes to the other side of the leg. Rest is necessary for a cure, which a high-heeled shoe will help forward. The inflammation should be removed by cold water dressings, and when the heat has disappeared, iodine ointment may be used, to produce absorption. The disease is obstinate, and when it occurs from rheumatism, a permanent cure is rare.

Oil to Prevent Decay.—"W. H. H.," Marlboro, Mass. Pine or other wood painted with boiled linseed-oil will last much longer. If exposed wood is well oiled once a year, it will resist decay about as well as if painted. Crude petroleum will preserve wood, and is much cheaper than linseed oil.

Silver Chaff Wheat.—"G. E.," St. Joseph, Mich. We can not recommend the wheat called "Silver Chaff," for light soils. In a trial with other kinds upon a light soil, this variety was worth nothing. How it may succeed upon a heavy soil is a question for investigation. It is safe never to risk a whole crop with a new variety, however well it may be spoken of elsewhere; the safe way is to sow a small quantity for trial at first. Wheat will not mix in the field.

Niagara Falls—Immense Water Power.—Dr. Siemens says 150,000,000 tons of water descend 150 feet every hour, which represent an aggregate of 16,800,000 horse-power. He calculates that 4 lbs. of coal burned per hour, in producing steam, gives a power equal to that of a horse working an hour; that to pump back the water falling over Niagara in a year, would require 266,000,000 tons of coal, which is more than all the coal used for steam purposes in the world.—As we figure it, then, the water-power of Niagara Falls, if all used, would be about the same as that of 34,000,000 horses, each working constantly for 12 hours a day. As a barrel of water weighs about 263 lbs., the fall of 150 million tons per hour, is equivalent to over 21 million barrels every minute, or 355,000 barrels of water every second!

Turner and Ross' Guns.—An advertisement of this firm appeared last year, after considerable investigation on our part. But because three or four of our readers complained of disappointment, we followed our usual custom, and omitted the advertisement, at considerable pecuniary loss, simply to be sure of being on the right side. The complaints received were looked into, and we believe were all made satisfactory. Messrs. T. & R. assure us that they themselves were deceived in a few of the thousands of guns sold by them, without knowing it at the time, and that they have been, and are anxious to do justly, and give entire satisfaction to every customer. If any others of our readers were disappointed, let them address Messrs. Turner & Ross, at Boston, and we shall be much mistaken if their complaints are not rectified.

Value of Salt-hay.—"L. D. B.," Palisades, N. Y. The feeding value of salt hay was given in an article by Professor Atwater, in the *American Agriculturist* for January, 1876, together with a table of values of many kinds of fodder, and a list of rations of these with various grains, by which comparatively poor fodder might be made equal to the best of hay. These tables are valuable, and should be kept for study and reference.

Save the Eyes—Reading and Writing.—Never read or write with the light shining into the eyes. It contracts the pupil and strains the eyes by the

effort to gather rays of light enough from the printed page to make it legible. Always have the light from the window or a lamp, come over the shoulder upon the reading matter, so that the eye itself can not see the direct light. This will greatly aid the sight and save the eyes. Never lean forward in reading or writing; it compresses the chest and lungs and injures the health. Let the shoulders be thrown back, and have the chest or breast stand well out and free. These simple rules followed, will not only aid the sight, but save one's health and vigor many years, and enable him to read and write much longer at a time without weariness. We always write our letters, as well as all copy for the *American Agriculturist*, upon a tablet held in front as nearly perpendicular as possible and have the ink flow from the pen; while the head is supported against a high-back chair, and the elbows by the chair-arms, so that the mind has no care of their support, but is left free to think. In this position, we can read and write six, and even ten hours or more when necessary, without great fatigue.

Too Much Ventilation.—"E. H.," Lebanon, Del. It is very easy to ventilate a cool cellar too much in the summer time. The warm air which enters, deposits moisture on the cold floor and walls as dew, and the cellar becomes damp and mouldy. It should be ventilated sparingly, and if damp, may be dried by putting in it a bushel of fresh burned lime in a box. This will absorb the moisture and make the air dry. When the lime is slaked down, spread it on the floor and use a fresh lot.

Ashes for Wheat.—"Boy Farmer." Woodashes contain more of the essential elements of plant-food than do the ashes of wheat straw, a large portion of the latter being silica; therefore the wood ashes are a more valuable fertilizer for any crop, wheat included. Any amount, from 10 to 50 bushels per acre, will be found beneficial; on an average soil, probably about 25 bushels would be most profitable for wheat.

Unleached Ashes.—"J. H. K." These, being adapted to any crop needing potash, are useful to nearly all. They give the best results on light, dry soils. The amount to apply per acre depends on the soil and the crop; any quantity, from 10 bushels upward, will result in substantial benefit.

Feather-eating Fowls.—"D. W. S.," Scranton, Pa. The habit of pulling and eating feathers is common among fowls confined. It is impossible to cure the fault when once acquired, and it is best to kill the fowls for table use at first sight, as they quickly teach others to do the same. The cause is doubtless a need or appetite for something contained in the feathers. A mixture of dried flesh and bone, specially prepared for poultry, with a small quantity of sulphur, will act as a preventive. Bits of fresh lean meat, or scraps, or finely powdered fresh bones, will answer. Our fowls, which are regularly supplied with the "Imperial Egg Food," show no such depravity, though very closely confined at this season.

Thatching Roofs.—"N. C. M.," and others. For full descriptions of thatching roofs with straw see *American Agriculturist* for July 1874, and May 1868.

The Angora Goat and its Uses.—"G. A.," Fort Davis, Texas. An article fully descriptive of the Angora Goat was given in the *American Agriculturist* of October, 1876. The market for the wool (called mohair), is quite restricted; one mill that we know of, is in Jamestown, N. Y. There is nothing in the goat or the fleece to make it preferable to sheep, excepting under circumstances in which sheep can not be kept profitably.

Eggs May be Carried Safely. we would say to "T. G. R.," Benton Co., Oregon, a long distance by water, as there is little jar or disturbance. Eggs have been known to hatch after having been brought from Europe to this country. The jar and constant vibration of railroad carriage is injurious to eggs used for incubation.

Peach-Stone Meats Poisonous.—Children, and some grown people, are fond of cracking peach-pits and eating the kernel or meat. The "London Globe" describes the painful death of a boy from eating them, and says one ounce of the kernels contain about one grain of hydrocyanic or prussic acid. We do not know as to the quantity, but this is one of the most virulent poisons known. One grain will kill an adult person, while ½ to ¾ of a grain will generally prove fatal to a child. In case of accidental poisoning, inhaling ammonia (spirits of hartshorn), and applying ice-cold water to the head, and pouring it along the spine, are helpful. The best antidote, when it can be quickly obtained, is to swallow 20 grains of carbonate of potassa, diluted in one or two ounces of water, and immediately after, 10 grains of sulphate of iron (copperas), and a drachm of tincture of chloride of iron, mixed in an ounce of water. The above amounts will neutralize nearly 2 grains of the hydrocyanic acid.

Plants Named.—"H. O. A.," Parkman, O. The "Common," or "Low Mallows" (*Malva rotundifolia*), a frequent, but not especially troublesome weed.—"W. K. C.," Plymouth, Mass. The "Tufted Vetch" (*Vicia Cracca*), one of the prettiest of the Vetches, and sparingly naturalized in the older States.—"J. B.," Venango Co., Pa. Lavender Cotton (*Santolina Chamaecyparissus*), a native of Europe, and more cultivated abroad than with us, for its very fine and silver-gray foliage.

A Sprained Shoulder.—"A. E. A.," Pawnee Co., Kansas. A sprained shoulder will not improve by rest. If some exercise is not given, the muscles will shrink, the sinews become shortened, and the lameness will be permanent. The proper treatment is, to apply some stimulating mixture, such as liquid ammonia, 1 part; olive oil, 2 parts; or camphorated spirit. If there is any heat and tenderness, cold water should be showered upon it by a syringe, or with the spraying nozzle of a hand force-pump, until these symptoms have subsided, when the liniment may be rubbed in. The horse should be walked about gently for an hour or so, twice a day.

"Horse Sorrel."—"J. H. K.," Wis. We know of no weed generally called by this name; the sorrel common as a weed, is often called "sheep sorrel," and this is probably the plant referred to. It is not a difficult weed to subdue, by occupying the soil with better plants. You do not say where it occurs; if in grass lands, encourage the growth by top dressing with the most available fertilizer. The old notion that it indicates a "sour soil," and lime must be applied to neutralize the acid has no other foundation than the fact that lime acts beneficially upon the soil and favors the growth of useful plants.

Feeding Jersey Cows.—"Baltimore." For a moderate-sized Jersey cow milking 10 quarts, and making 1 lb. of butter a day, the following ration of the mentioned food would at least be required: Cut corn-fodder of the best quality, and well cured, 12 lbs.; mixed bran and heavy middlings, 4 quarts; of roots, one peck at noon, cut, and sprinkled with a quart of middlings. It is best to wet cut fodder, mixing with it the middlings and bran.

No Cure for Spring-Halt.—"S. M.," Riverside, Va. "Spring-halt" is the result of a defective nervous action, and is usually beyond the reach of medicine or treatment. Sometimes the affection may become relieved through an improved general condition, but usually, as the horse gets older, the trouble becomes worse, and weakness of the limbs and general debility increases. Nutritious food, tonics, and the best care are palliatives.

Renovating an Orchard.—"J. J. L.," Louisville, Ark. We would not advise sowing grain of any kind. If you can not give it a generous manuring, then sow clover, or cow peas, to be either turned under, or pastured by swine; after this, a good dressing of lime or ashes would be beneficial. If the trees are full grown, or have reached bearing size, they need all the nutriment the soil can afford, and no crop that is to be taken away from the land, should be grown in the orchard.

Lost Teats May be Recovered.—"M. J. G.," Irving, Minn. When from any cause a young cow loses the use of one or more of her teats, or their functions cease, there is probability of recovery, if proper means are used. These are, to rub the affected part of the udder with gentle kneading for half an hour daily, to apply with the rubbing iodine ointment, diluted with twice the quantity of glycerine; to milk the teats in the usual manner at every milking time, and if there seems to be any obstruction in the teat, to inject a solution of one teaspoonful of soda in a teaspoonful of water, and after 10 minutes to milk it out.

Norman and Clydesdale Horses.—"O. H. H.," Mount Airy, Iowa. The differences between the Norman and Clydesdale horses are, that the Normans are generally dark iron, or light dappled gray, and are coarser built animals than the latter, which are generally brown or bay, and are very well proportioned and fine boned. The Normans should not be confounded with the Percherons, which are a purer bred race, finer limbed, and light gray, brown, or bay in color; these two kinds of horses are both natives of France, one of Normandy and the other of a district called La Perche.

The Squirrel Pest is one of the great annoyances of the California farmer, and various are the devices for destroying them. One Mr. Benton takes contracts to clear farms at 9 to 10 cents per acre, according to their size. One farmer declined to pay this price, but was willing to give 4 cents a head for all the squirrels destroyed. He probably found he had not made a very shrewd bargain when Mr. B. drove up to his house with so many wagon loads of squirrels that it took a check of \$500 to pay according to the terms of his agreement.

Parents and Teachers will be interested in the advertisement of New School Books, by Messrs. D. Appleton & Co., which we commend to their attention.

Differences Between Hill and Valley Land.—"P. Y. P.," Phila. It is a mistake to suppose that a greater number of plants can be grown upon sloping land than upon land having the area of the horizontal base of the slope; or that more rain falls upon such a surface, or that more pickets are required for a fence upon such ground. This can be proved by drawing a sloping line with a horizontal base line beneath it, and then a series of lines perpendicular to the base.

Patent Gates.—"J. W. M.," Monroe Co., Mich. If a person has used a gate for 19 years, and can prove it, he cannot be compelled to pay a license for its use on any patent taken in 1865.

Catalogues Received.

NURSERYMEN.

J. W. ADAMS, Springfield, Mass.—Special strawberry list, with directions for culture.

EDWIN ALLEN, New Brunswick, N. J.—A comprehensive list of fruit trees, small fruits, ornamental trees, shrubs, etc., grown at the "New Brunswick Nurseries."

WM. F. BASSETT, Hammon, N. J.—Strawberries, including the novelties.

P. J. BERCKMANS, Augusta, Ga.—Wholesale and retail list from, in every department, the most extensive nursery in the Southern States.

H. H. BERGER, San Francisco, Cal.—Japan Persimmons and other Japanese trees.

CAYUGA LAKE NURSERIES, Union Springs, N. Y.—Offer stock very low to the trade this fall.

J. LEWIS CHILDS, Queens, N. Y.—Is getting to be an extensive purveyor to florists and gardeners, and this fall sends out a full list of hardy bulbs.

JOHN S. COLLINS, Moorestown, N. J.—Price list of strawberries, raspberries, blackberries, currants, grapes, etc., with strawberries as a specialty.

J. DILLON, Bloomsburg, Pa.—Strawberry catalogue, including the "Sharpless."

ELLWANGER & BARRY, Rochester, N. Y.—Send the 23d edition of their Fruit Catalogue, which, besides giving the prices for an immense variety of fruits, including several new ones, is valuable for its information. The same applies to their special Strawberry Catalogue.

H. M. ENGLE & SON, Marietta, Pa.—Circular of New Early Peaches with colored plate of the "Wilden."

FERRIS, MINARD & CO., Poughkeepsie, N. Y.—Send their "Wholesale Nursery Trade List" for 1878-79, which offers a full stock of the standard sorts.

A. HANCE & SON, Red Bank, N. J.—Strawberry Catalogue—especially new and old sorts pot-layered.

T. S. HUBBARD, Fredonia, N. Y.—Wholesale list of general stock. Vines a specialty.

W. W. JOHNSON, Central Lake, Antrim Co., Mich.—Native and other forest trees and tree seeds.

WM. S. LITTLE, Rochester, N. Y.—Semi-annual wholesale price-list of fruit and ornamental trees, etc.

E. MOODY & SONS, Lockport, N. Y.—Wholesale list, with special rates by the car-load, are offered by this, one of the oldest and best known of nurseries.

N. OHMER, Dayton, O., makes a specialty of the "Gregg" raspberry, which receives strong testimonials from some of the leading growers.

WILLIAM PARRY, Cinnaminson, N. J.—Several lists setting forth a number of novelties in small fruits.

E. B. RICHARDSON, Geneva, N. Y.—Wholesale trade list of general stock.

E. P. ROE, Cornwall-on-Hudson, Orange Co., N. Y.—As usual makes his catalogue something more than a mere price list, with his notes and comments. His new gooseberries heretofore have been exempt from mildew, and we should not have known that they did otherwise this year, had he not published the fact himself.

HENRY S. RUPP, Shiremanstown, Pa.—Supplemental list of fruit and other trees at greatly reduced rates.

STEELE BROTHERS, La Porte, Ind.—Small fruits and cuttings of the same.

THE CO-OPERATIVE NURSERY & FRUIT CO., of Los Angeles, Cal., make their bow to the public with "500,000 first class healthy, well-grown Orange and Lemon trees." We recognize some familiar names in the "company," which makes such a numerous bow.

F. TROWBRIDGE, Milford, Conn.—Special catalogue of cranberries.

E. & J. C. WILLIAMS, Montclair, N. J.—Devote themselves to small fruits. Among the novelties is the "Montclair," a new raspberry of their own.

SEEDSMEN, FLORISTS, AND BULB DEALERS.

The general seed catalogues are not usually ready before February, but most dealers issue a full list for new bulbs, and other articles in season. Neither is it the usual time for florists' catalogues, and we place the few that have come to hand, with the seedsmen's lists.

B. K. BLISS & SONS, 34 Barclay street, N. Y.—Their "Autumn Catalogue of Flowering Bulbs and Small Fruits" contains 72 pages, is fully illustrated and enumerates a wide variety of things appropriate to the season.

WM. H. CARSON, 125 Chambers St., N. Y.—A full assortment of bulbs; seeds for the season and small fruits.

L. B. CASE, Richmond, Ind.—His "Botanical Index" besides serving as a catalogue, gives interesting items about plants.

WM. MORTON & SON, Allen's Corner (near Portland), Me.—Florists' stock in variety.

ARNOLD PUTZ, Jacksonville, Fla.—Native and other plants, dried grasses, etc.

AVG. ROLKER & SONS, 44 Dey St., N. Y.—Importer of Holland Bulbs, Flower-roots, and Florists' supplies.

GEORGE SUCH, South Amboy, N. J.—Issues his catalogue of stove and greenhouse plants, which is pleasant to look upon for its neatness, and satisfying in the rare excellence of the stock. For the first time, Mr. S. issues a special Bulb Catalogue, handsome enough to be the companion of the other.

J. M. THORBURN & CO., No. 15 John St., N. Y.—Besides a full assortment of the usual kinds of hardy bulbs, a very large list of the rare sorts and greenhouse bulbs.

JAMES VICK, Rochester, N. Y.—Sends his "Floral Guide" for Autumn, and as usual it is full of good things.

LIVE STOCK.

E. F. BROCKWAY, Ainsworth, Iowa.—Poland China Hogs and Poultry. Also Artichokes to feed the pigs, and evergreen trees for shelter, (we suppose).

JOHN S. COLLINS, Moorestown, N. J.—Catalogue of Jersey Red Swine.

BENSON, MAULE & CO., Philadelphia, Pa.—This firm are extensive dealers in blooded stock, including Jersey, Guernsey, Ayrshire, and Shorthorn cattle, and the popular breeds of sheep, swine, and poultry. They combine in their large, illustrated catalogue, announcements of their seed and plant business. It is said that the sales of this concern are rapidly increasing—a pretty good indication of the way they treat their customers.

"RIVERSIDE FARM," owned by C. B. Matlocks, Portland, Me.—Mr. M. makes a specialty of Berkshire Swine, Coltshead Sheep, Bronze Turkeys, Pekin Ducks, and Light Brahma Fowls. Many of his sheep and swine have long pedigrees, as set forth in his handsome catalogue.

GEO. G. MAXON, Schenectady, N. Y.—The "Riverside Herd" of Shorthorns have some choice blood in them, if an illustrious ancestry can give it.

E. E. HARDIN & CO., Scotia, N. Y.—Breed and offer for sale all kinds of fancy poultry.

J. T. STRONG, Lansing, Mich.—Deals in fancy fowls, rabbits, including the pretty Angora and English varieties, Guinea pigs, etc.

M. B. ROWE, Fredericksburg, Va.—Offers eggs for hatching, and Jersey and Ayrshire cattle for sale.

T. L. MILLER, Beecher, Ill.—Is a strong advocate of the Herefords as beef cattle, and claims their superiority to any others, even the widely popular Shorthorns. He sends some fine looking pictures of his favorite cattle.

IMPLEMENTS AND MISCELLANEOUS.

CLOUGH REFINING COMPANY, Cincinnati, O.—This company offer machinery for refining sorghum syrup and sugar by a special process, which meets with general favor, to judge from the testimonials of chemists and cane growers, given in their pamphlet.

DAIRY SUPPLY CO., No. 15 Murray street, N. Y.—Make a specialty of the Pendulum Churn, "The Monitor," and set forth its merits in a pamphlet which will interest butter makers.

THE BRADFORD MILL CO., Cincinnati, O., manufacture grist-mills which seem to be well liked by those who use them. Their "improved portable mills" they consider equal to any, and take pardonable pride in extolling the excellence of their machines.

A. J. FINNIGAN, Minneapolis, Minn., offers one hundred to five hundred dollars for a better butter package than his "air-tight butter package."

DR. M. H. WINNERBENER, Chicago, Ill., has just invented a "combined cultivator and irrigator," which at least has the merit of novelty. He has the good judgment to quote from the *American Agriculturist*, in support of irrigation as a practice.

JUST PUBLISHED.

CHART OF THE AGE OF THE DOMESTIC ANIMALS.

By A. LIAUTARD, M. D., V. S.

(American Veterinary College.)

In this "Chart," which is fully illustrated and printed on card-board, making a handsome sheet for framing, much valuable information is given in a concise and intelligible way, enabling one to determine the age of Horses, Cattle, Sheep, Dogs, and Pigs. It is what has long been wanted and often inquired for by stock breeders, and one of these Charts ought to be hanging in sight of every man who has anything to do with the management of domestic animals. The size of the Chart is 21½ x 23½ inches. It will be sent by mail, post-paid, on receipt of price, \$1.00.

ORANGE JUDD COMPANY,
245 Broadway, New York.

IMPORTANT

To Parents, School Trustees, & Teachers of Country Schools.

Before the winter term begins, send for description of
APPLETON'S

New and Beautiful Reading Books.

Freshest and most attractive School Readers ever made. Charming to Pupils, and delightful to Teachers. All the improved methods of Teaching admirably presented. The Teacher using them says: "We have never had such success before."—Don't fail to see them before your Schools open.

The Model Copy Books, with Sliding Copies

"That's it!" "Just the thing!" "A capital idea!" "A Signal Improvement!" Such are the exclamations of Teachers on examining the Model Copy Books. Their superiority is unquestionable.

Unusually favorable terms for introduction and Exchanges. Please address at once, referring to this advertisement.

D. APPLETON & CO., Publishers,
549 & 551 Broadway, New York.

TO FARMERS.

Their Sons and Daughters

Who wish to make money this fall and winter. We can give you Employment, honorable, pleasant, and remunerative; at home or abroad. Send for information to

American Publishing Company, Hartford, Ct.
or, 118 Randolph St., Chicago, Ill.

This book needs no Endorsement.—**DR. PALMER.**

AGENTS WANTED FOR DR. MARCH'S NEW BOOK, DARK TO DAWN

In this new volume the Popular Author of NIGHT SCENES IN THE BIBLE portrays with vivid and thrilling force and eloquence the events of Sacred Truth, and adds fresh testimony to the beauty, pathos and sublimity of the Stories of the Bible. Agents will find this Book with its sparkling thoughts, glowing style, beautiful Engravings, and rich bindings, the best in the market. **Terms Liberal. Circulars Free.** Address, **J. C. McCURDY & CO., Phila., Pa.**

GET THE BEST.

Webster's Unabridged. THE STANDARD

For Schools,—recommended by State Supt's of 35 States, and by 50 College Pres'ts, about 32,000 have been placed in Public Schools by law or by School Officers. It contains 3000 Illustrations, nearly three times as many as any other Dictionary. The "Dictionary used in the Government Printing Office is Webster's." Aug. 4, 1877. Sale of Webster's is 20 times as great as that of any other series of Dictionaries. Published by **G. & C. MERRIAM, Springfield, Mass.**

TELEPHONES

For Business Purposes, ours excel all others in clearness & volume of tone. Illustrated circular & testimonials for 3 cts. Address **J. R. HOLCOMB, Mallet Creek, Ohio.**

50 Flowered, Diamond, CARDS only 10c. Name neatly printed on all. Star Printing Co., Northford, Ct.

A GENUINE
GROVER & BAKER
Sewing Machine.

This engraving exactly represents the machine with the box cover off.

\$70 FOR \$15.

Grover & Baker machine. It is made of the best material, always hold the high and distinguished place ever accorded to true worth and merit. Ladies, this is the greatest offer ever made to you. The number of machines which we can offer is limited, and we must receive your order at once as we cannot promise the machine after 60 days from the date of this paper. Every machine is in perfect running order, carefully boxed, and delivered FREE aboard cars or steamer. It can be sent by express or freight to any part of the world. On receipt of \$5 we will send it to any place east of Ohio or north of Virginia, C. O. D. for balance due. If it is to be sent as freight payment in full must accompany order. Remit by Registered Letter, Post-office Money Order, or Bank Check. Perfect satisfaction and a complete substantiation of every statement made guaranteed, or money refunded. Write your address plainly; be particular how to ship, by freight or express; don't fail to do this. Address, The Turner Manufacturing Co., 93 Water St., Boston, Mass., U. S. A. Do not conflict this new and latest improved \$70 machine with an old-fashioned noisy one advertised in some papers for a less price. ORDER AT ONCE. N. B.—Each machine is mounted on patent castors, for which nearly all other companies charge extra, and complete instructions (explicit enough for a child to understand). When the payment in full comes with the order we will give FREE three hemmers, one braider, one friller, one quilting gauge, one gauge and screw, and one embroidery plate. These will not be given free when the machine is sent C. O. D. or otherwise than Cash with order. For our reliability, refer to any editor in our city.

SAFETY, COMFORT, ECONOMY!

THE RUBBER CUSHIONED AXLE

reduces breaking, jarring, jolting, vibration, and noise to a minimum, thereby assuring greater safety and comfort in riding, with a large saving in wear and tear. It also saves horse power by lessening traction, and therefore is of special value to **SULKIES and ROAD WAGONS.** It will improve the riding and wearing qualities of any vehicle, whether **LIGHT or HEAVY**, however good its construction or easy its springs.

CORRESPONDENCE INVITED.

THE RUBBER CUSHIONED AXLE CO.,
Broadway and 43d St. (Long Acre), New York.

Scribner's Lumber & Log-Book.

OVER HALF A MILLION SOLD. Most complete book of its kind ever published. Gives measurement of all kinds of lumber, logs, and plank, by Doyle's Rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cordwood tables, interest, etc. Standard Book throughout United States and Canada.

Ask your bookseller for it, or one sent by me for 35 cents, post-paid.

The Chamberlin Screw Stump Machine,

after 10 years test, has proved its superiority over all others, by its great exhibition of strength and durability, combined with cheapness and ease in pulling all classes of stumps. The Company's challenge of \$1000 for a stump machine which would excel theirs, has stood since 1867 without being taken. They build 6 different sizes of machines, to pull all kinds of stumps. They make Subsoilers and Discing Plows. For Particulars, Prices, etc., address **THE CHAMBERLIN MFG CO., Olean, N. Y.**

CORN HUSKER.

No cold or sore fingers, if used with gloves or mittens. Can be used without gloves or mittens, if desired. Will last a life time. Taken 6 Premiums. One sample 25 cts.; two for 45 cts.; 5 for \$1.00.

No. 91 JOHN ST., NEW YORK.

HENRY HOE, Sole Agent. JOSEPH GILLOTT & SONS.

The Monitor Seed Drill.

This is the most complete and positive Seed Drill ever invented. It is radically different from and superior to all others. It is the **only** machine which measures and drops the seed with a positive motion, and exactly the same amount at each foot or yard. It has been tested by 5 years' use in Massachusetts, and was awarded the highest prize at the "Centennial." The "Monitor" has been thoroughly tested during the season of 1878, and heartily endorsed as a **First Class Machine** by Professor Geo. Thurber, of New Jersey, and by Jas. Vick, of Rochester, N. Y.

Agents Wanted.—For full descriptive circular and testimonials, address THE MERRIMAC MACHINE CO., Newburyport, Mass.

ADAMS' PATENT SELF-FEEDING POWER CORN SHELLERS.

Strong, reliable, thorough in all parts of their work, (shelling, separating, cleaning, and elevating.) Perfect self-feeders, and best machines for mill and warehouse purposes, as well as for farm and plantation. Their superiority attested by twenty years' use in the heavy corn-growing sections, during which time they have received first premium at all State and World's Fairs wherever exhibited.

MADE BY THE

Sandwich Manufacturing Co.,

Who are also makers of

The Best Hand Corn Shellers in the Market.

Send for Circulars.

These Machines will be on exhibition at leading State Fairs East and West.

CHICAGO-ENG.-CO.

Portable Mulay Saw Mill,

With improvements recently made is unequalled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubs, and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

A WANT SUPPLIED.

I have invented and tested a portable, self-supporting Truss Fence. Can be made under cover, costs 20 cts. less per panel than common board fence. No patent on it; free to all. Send 25 cts. for illustrated Pamphlet, with full directions for making. Address

WALDO F. BROWN,

Box 75. Oxford, Ohio.

The Silver & Deming Feed Cutter,

Celebrated for its great capacity, ease of running, and its adaptability to all kinds of work. Our Power Cutters are fitted with an IMPROVED SAFETY FLY WHEEL, and in the event of iron or other hard substances getting into the feed the Fly Wheel revolves, but the knives stop, thereby securing safety to the machine and to the operator. SEND FOR CIRCULAR.

"DEFIANCE" SPRING WHEAT.—Premium 2.

Good Things Free.

As stated on page 361, the Publishers are preparing an *extensive assortment of Good Things* to be presented to their friends who gather and forward subscriptions for the *American Agriculturist*. We cannot find room for this list in the regular paper, but will mail a *free* copy of the full Illustrated and complete Descriptive list to any one who will send his or her address on a postal card, and say: "For a Premium List."

As many are desirous of beginning to collect subscribers, we insert here a very *few only* of the many articles to be offered.

Names of subscribers can be sent along now as fast as gathered, and all names marked "For Premiums," will be entered to the credit of the sender.

The Premiums will be given for a specified number of subscribers at the regular rate of \$1.50 a year, post-free,

BUT any person sending at least twenty subscribers and upward, at the lowest rate of \$1 a year, post-free, will be allowed to order any premium offered to the amount of 10 cents for each subscriber sent by him; or, for every club of twenty subscribers, at \$1.00 each, an extra copy of the paper will be given, without other Premiums.

Nos. 1, 2.—New Hybrid Spring Wheat.—After a careful trial of six years, Messrs. B. K. Bliss & Sons, who are known as one of the most reliable seed houses in New York City, offer to the public the two varieties of Spring Wheat, the **Champlain** and the **Defiance**, which we present as Premiums, feeling assured that they will be *valuable acquisitions* to the wheat-growers of the country. We have seen specimens of both varieties, raised in widely separated portions of the country, and they appear fully to sustain what is claimed for them. Premium No. 1, the **Champlain** Spring Wheat, was produced in 1870, by Mr. Pringle, in his endeavors to unite the remarkable hardiness of the Black Sea with the fine and superior quality of the Golden Drop. Several varieties were the result of this hybridization, from which this one was chosen, as realizing the end in view, showing greatly increased vigor and productiveness over both its parents. A careful selection from this for the past seven years has now fully established its character, and we have a wheat bearded like the Black Sea, with the white chaff of the Golden Drop, free from rust and smut, yielding a lighter-colored grain than the former, which makes a flour of *superior quality*. Its strong and vigorous straw, growing 6 to 12 inches higher than its parent varieties, stands erect, frequently bearing even in very ordinary culture heads from 5 to 6 inches in length, containing from 60 to 75 kernels each. We confidently recommend this new wheat as among the earliest, promising to give the grower of this most important crop better results than are produced by the old and "run out" varieties now sown. Four subscriptions, at \$1.50 each, will secure **three pounds** of this wheat, sent post-paid.

Premium No. 2, the **Defiance**, is another variety

of Spring Wheat of the highest promise, the result of a series of experiments by Mr. Pringle in 1871, to incorporate superior qualities upon the hardy stock of our common Club Wheat, by hybridizing it with one of the finest, whitest, and most extensively grown sorts of the Pacific Coast. This variety displays great productiveness, vigor, and hardiness. It is a beardless, white chaff wheat, with heads frequently 5 to 6 inches long, very closely set with large white kernels, frequently numbering 75 to 80 to the single head. Its white, stiff, erect straw, exempt from the attack of rust, its earliness, combined with great vigor and superior qualities, should claim for it universal trial. [See engraving]. Four subscriptions, at \$1.50 each, will secure **three pounds** of this wheat, sent post-paid.

No. 3.—"Our Boys'" Wagon.—

For the use of Boys from 6 to 15 years of age. The bed is 2 ft. 8 in. long, 1 foot 3 in. wide, and 5 in. deep. The wheels are all iron, the spindles also of iron. It is finely painted, a first-rate and handsome wagon, and will carry a weight of 400 to 500 lbs. on a level road. Made by the Silver & Denning Manufg Co., Salem, Ohio. 12 subscriptions, at \$1.50 each, will secure it, or we will supply one for \$8. The freight from the factory in either case to be paid by receiver.

No. 4.—Mutton in Parvo Pocket Knife.—Boys, Read this.

Yes, and the Men, too. Mr. J. D. D. thinks more of this than any other article of twice its cost. He obtained one in London just *eleven years* ago, which he *still carries*, and says it far more than pays the interest on \$100, (2 cents a day,) for, aside from its ordinary use as a double-bladed knife, some one of its "tools" is often worth a "quarter," by being on hand and just the thing wanted in an emergency. He sent an order to England at three different times, but only received much larger, clumsier articles, less effective, and costing \$5 each, and finally learned that the original maker was dead. He then got some English cutlery here to make them, but they did not always succeed in keeping up a supply of first-class articles. We now get them *all right* of the MERIDEN CUTLERY COMPANY, and much cheaper than any imported. (Mr. Judd could find none as desirable while in London on his last visit.)

[Mr. Judd's

special favorite]

Premium 4 [Open.]

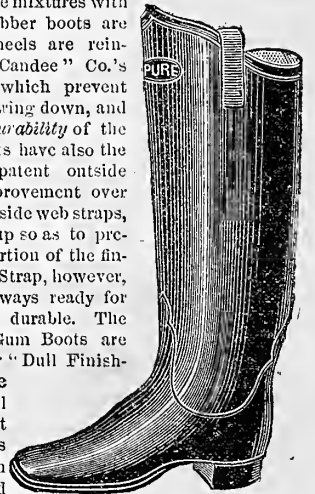

Premium 4 [Closed.]

The *Saw* is double-toothed, and will cut an inch board, saw off a good-sized stick, cut a notch, etc. The *Ik* &

convenient, of course. The *Tweezers* and long *Pointer*, or *Brad-awl*, drawn from the end of the handle, often come into use. The back of the Hook makes a good *Hammer* for tacks, and small pounding. The inside of the Hook forms a small *Nut-cracker*. All close into a compact white handle, the whole weighing only 2 ounces. IT IS A POCKET-FUL OF TOOLS. Seven subscribers at \$1.50 each brings it *free*, post-paid.—[We will send one, post-paid, for \$3.50.]

Nos. 5, 6.—Men's and Boys' Pure

Gum Boots.—The "Candee" Pure Gum Boots (L. Candee & Co., New Haven, Conn.) are made with a view to great durability, and are claimed to be entirely free from the adulterative mixtures with which common rubber boots are cheapened. The heels are reinforced with the "Candee" Co.'s patent *heel irons*, which prevent the heels from wearing down, and therefore add to *durability* of the Boots. These Boots have also the "Candee" Co.'s patent outside straps, a great improvement over the old-fashioned inside web straps, which always curl up so as to prevent the quick insertion of the fingers. The Outside Strap, however, is quite handy, always ready for use, and perfectly durable. The "Candee" Pure Gum Boots are either varnished, or "Dull Finish." Experience shows that the dull finish boots are not quite so durable as those protected from the atmosphere and from the ammonia of

"CANDEE" PURE GUM BOOT.

barnyard-manures by a coat of varnish. Hence the manufacturers recommend the Varnished Pure Gum Boots, and warrant every pair to give reasonable satisfaction. We offer the Men's Size for 8 subscribers, at \$1.50 each, or the Boys' Size for 6 subscribers, at \$1.50 each. Carriage to be paid by receiver. In ordering these Premiums, state the size of the shoe you wear.

No. 7.—House-

hold Press.—

This is one of the most convenient little inventions for the housekeeper that we have seen. It is designed for pressing corned beef, spiced meats, boned turkey and chicken. By an easy change of the bottom, the press can be used in making jellies, cider, or pressing out lard, tallow, herbs, or beef for tea for invalids, and in many other ways. Supplied by W. A. BOARDMAN, Medway, Mass. We will send one *free* for 4 subscribers at \$1.50 each, [or on receipt of the price, \$2.00.] Expressage to be paid by Receiver.

Premium 7

No. 8.—Bracket-Saw Drill, No. 1.

—A very useful little tool. The Drill Stock, and Six Drill Points, and Wrench, are packed in a box. For only Three subscribers at \$1.50 each, we will send the Drill, or we will supply it to any one, post-paid, for \$1.15.

[For the description of a **Great Number** of other most valuable Premiums, send your address by Postal Card to ORANGE JUDD COMPANY.]

THE "Model Piano."

PRICE \$150 to \$200.

The "MODEL" is a beautiful little Upright or Cottage piano; it is manufactured from the best materials that can be procured; the workmanship is excellent, and its durability is guaranteed; it is small, light, and occupies but little room, is easily transported, and above all the "MODEL" is sold at about one-third the price that is usually paid for any other reliable piano. For the above reasons, it is very suitable for people of moderate means, and those living in small houses; but it is especially adapted for beginners, and on account of its low price, commands itself to every parent, because it possesses all the principal disadvantages of the finest piano, and has none of the numerous disadvantages of the reed organ.

For full particulars write for illustrated pamphlet, and state where you saw this notice.

NEW ECONOMIZER

AGRICULTURAL ENGINE.

The cheapest, most economical yet powerful Engine in the market; and is the only Agricultural Engine with Return Flue Boiler in use.

There is no obstruction whatever to the draft, yet the returning of the flames through the small tubes compels the deposit of the great body of sparks in the chamber rear of the boiler.

It is the best and safest Steaming Boiler in use, and we invite competition with any first-class maker. It will make more steam from less fuel than any horizontal boiler built. Before buying, see one or send for full particulars, circulars, etc., which will be sent free by addressing

WHITMAN & BURRELL,
Little Falls, N. Y.

Also Manufacturers and Dealers in Cheese Factory Outfits and Supplies.

N. B.—The Economizer Boilers are manufactured for us (in duplicate parts), under United States patents, by Porter Manufacturing Company, Syracuse, N. Y., thus securing perfection and uniformity. The demand is unprecedented, even in these dull times.

SNYDER'S "Little Giant" STEAM ENGINE.

For Farmers, Machinists, Printers, and all requiring Light Power.

Sizes from One to Six H. P. Prices for Engine and Boiler complete, from \$150 to \$450. We make the Strongest Boiler and the Best Engine in the country. Call at our Factory and examine, or send for free Illustrated and Descriptive Catalogue.

WARD B. SNYDER,
94 Fulton St., New York.

SKINNER PORTABLE ENGINE

2½ to 10 H. P.

Made by Special tools.

All parts duplicated.

SKINNER & WOOD,
Erie, Pa.

MY TRUSS FENCE is cheap and durable. See advertisement on page 897.

THE WONDERFUL \$3 JIG SAW.

In the July No. American Agriculturist, page 277, appeared a large 3 col. advertisement and description of this really wonderful machine—wonderful on account of its great capability, practicality, and its marvellous cheapness. Made from finest selected stock (no poor material of any kind in it), and by skilled labor. It is at once the cheapest, most capable, and most restful piece of machinery in the world. It is NOT an amateur machine; professional mechanics use it. It will saw out stuff 1 inch thick readily. It runs true as a die, and the most intricate scroll sawing, fine as lace work, can be made with one. For carriage makers, cabinet makers, and fancy carpenter work generally, it is as good as any \$25 machine, and it takes in larger work than most of them. For boys bracket saving, &c., it is truly a prize, and it pays for itself in 2 days. Parents teach their boys a trade, and amuse them at the same time. Bracket saw work commands good prices, and good mechanics good wages. A single one of these machines could not be made for \$15. We make them by the 100, and sell for the lowest possible price. Only \$3 for the genuine Improved Jig Saw, and My Companion Jig Saw, and over \$2 worth of designs, saws, illustrated lessons, &c., &c., given free with each machine. Sent by freight or express on receipt of price. Saw complete, \$3. Saw and drilling attachment, \$3.50. Saw, drill, powerful turning lathe, and circular or buzz saw, \$5. Satisfaction guaranteed, or your money cheerfully refunded. All orders must be sent to The Turner Manufacturing Co., 93 Water Street, Boston, Mass., for this machine.

ESTABLISHED 1852.

R. W. CAMERON & CO., Shipping and Commission Merchants,

23 South William St., New York.

Proprietors of the "DIAMOND," and "LIGHT OF THE AGE" Brands of Oil, and Pioneer Line of Ships for Australia, New Zealand, and the East. Cash advances made on consignments of Wool, Tin, and other approved produce, from Australia and New Zealand. Orders solicited for American productions, accompanied by approved credits.

Culminating Triumph of the 19th Century.

The greatest invention since that of the Breech-Loader.

Price, \$12.

The Auxiliary Rifle Barrel embodies the results that have been sought after for years, viz., to change a breech-loading shot-gun to a rifle at a moment's notice. In the simplicity of this invention lies its unprecedented success. There are no screws or nuts, and it is inserted in the shot-gun barrel same as a cartridge in a gun, and ejected likewise and with the same rapidity. The Rifle Barrel rests on two bearings which perfectly centre the shot-gun barrel. The rear bearing will always fit the gauge for which it is ordered. The front bearing is a detachable washer or ring; several of these go with each barrel; they vary 1/16 of an inch, and one of these will invariably fit. The Auxiliary Rifle Barrel is made by the Winchester Repeating Arms Co., and GUARANTEED PERFECT, ACCURATE, AND OF THE BEST MATERIAL, BY THEM. And the shot-gun sustains no injury from its contact with or the use of the Rifle. A long range target affix to attach to grip of shot-gun sent with every Auxiliary Rifle. The "Auxiliary" has held its own at every match in which it has been used, and at 200, 500, and 600 yards it has made as good scores as a \$100 Sharp or Remington. Too much cannot be said of it. Every sportsman endorses it. Among dozens of testimonials the following well-known rifleman enthusiastically praise it for target and sporting use: Gen. S. R. Smith, New Haven, Ct.; James Kent, Buffalo, N. Y.; G. A. Spross, Toledo, Ohio; G. H. Davis (U. S. Mint), Carson, Nev.; C. C. Tiff, Glenville, Ct.; L. C. Bruce, Ira Payne, Capt. Bogardus, Judge Blydenburg, and a host of others. The fact that they are made by the Winchester Arms Co. is alone sufficient guarantee of workmanship. They will (in 44 calibre) give a penetration of 4 inches (pine) at 1,000 yards, and are as good as any Rifle made for accuracy. They take up but little room, and do not tire the sportsman. In ordering, the bore of the gun for which they are intended is the ONLY measurement required. The Rifles are made in .32, .38, .44, and .46 (government) calibres, all centre fire, and chambered for long range cartridges. Price, to fit either 10 or 12 bore shot-guns, \$12. This includes ejector, long range target, sight, brush, and swab stick. Sent by express on receipt of price, or by mail at purchaser's risk, for 35 cents extra. All orders promptly filled. Address the Bay State Arms Co., 93 Water St., Boston, Mass. Every one guaranteed.

NEW EDITION JUST OUT

Of a Most Valuable and Elegantly
Illustrated Work on Insects.

HARRIS'

Insects Injurious to Vegetation.

By the late THADDEUS WM. HARRIS, M.D., octavo, 640 pp., enlarged and improved with additions from the author's manuscripts and original notes. Illustrated by engravings drawn from nature, under the supervision of PROF. AGASSIZ. Edited by CHARLES L. FLINT, Secretary of the Mass. State Board of Agriculture.

The work is fully illustrated with two hundred and seventy-eight fine wood cuts, and eight beautiful steel plates, full-page size, containing ninety-five figures. It is believed that very great scientific accuracy has thus been secured in the illustrations. Published in two beautiful editions; one plain, with steel engravings, extra cloth, price, post paid, \$4.00; the other in extra cloth, beveled boards, red edges, engravings colored with great accuracy, price, post-paid, \$6.50.

ORANGE JUDD CO., 245 Broadway, New York.

Byrne's Lumber and Log Book, Ready-Reckoner and Price Book.

By OLIVER BYRNE,
Civil, Military, and Mechanical Engineer.

"Byrne's Ready Reckoner" is one of the most concise, complete and correct works ever issued. Among its contents will be found Tables arranged to show values from one-sixteenth of a cent each upwards; Tables of Board, Scantling and Plank Measure; Logs reduced to Board Measure; Round Timber when Squared; also Spars and other Timber; Wages and Board by the Week; Interest Tables at .06 and .07 per cent from \$1.00 to \$30,000; Compound Interest Tables from 1 to 25 years; Standard Weights and Measures; Gold and Silver Coins of the United States; Value of Foreign Coins as fixed by the Laws of the United States; Foreign Measures of Length compared with American; "How Interest Earns"; Laws of each State and Territory regarding Rates of Interest and Penalties for Usury; Statutes of Limitations in the several States and Territories, etc., etc. All comprised in 1 volume, 18mo, of 180 pages, bound in illustrated board covers, extra cloth back, title in gold. Price, post-paid, 35 cents.

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

BACK VOLUMES OF American Agriculturist.

The publishers of the *American Agriculturist* can supply any of the back volumes of that paper from the Sixteenth to the Thirty-sixth. These volumes contain more varied and interesting information on all matters pertaining to the Farm, Garden, and Household, than can be obtained in books costing three times as much money. Price of each bound volume, at the Office, \$2.00; sent post-paid, \$2.30. ORANGE JUDD COMPANY, 245 Broadway, N. Y.

SYRACUSE, N. Y.

Portable Mulay Saw Mill,

With improvements re-
cently made is unequal-
led as a neighborhood
mill. It can be run by
either steam or water
power, and is especially
adapted to the engines
used for threshing.

It may be operated
by either two or three
men, and will cut as
much lumber in pro-
portion to the power
and number of hands
employed as mills of
larger capacity.

It makes smooth and even lumber, leaves no stubs!
And will cut any sized log up to four feet in diameter. It may
be transported from one locality to another and re-erected ready
for sawing in from two to three days, and can be made profit-
able in localities where there is not sufficient timber to justify
the erection of a large mill. Send for descriptive circular, price,
etc., to **CHANDLER & TAYLOR**, Indianapolis, Ind.

Agricultural

Insurance Company, of Watertown, N. Y.

CAUTION TO THE PUBLIC.

To avoid imposition, purchasers of Waltham watches will
observe that every genuine watch, whether gold or silver,
bears our trade-mark on both case and movement.

Gold cases are stamped "A. W. Co." and guarantee cer-
tificates accompany them. Silver cases are stamped "Am.
Watch Co., Waltham, Mass., Sterling Silver," and are ac-
companied by guarantee certificates, signed R. E. Robbins,
Treasurer. The name "Waltham" is plainly engraved
upon all movements, irrespective of other distinguishing
marks.

This caution is rendered necessary by reason of the fact
that our cases are frequently separated from our movements
and put upon worthless movements of other makers, and
vice versa, thus affecting injuriously the performance of the
watches and vitiating our guarantee, which is intended to
cover only our complete watches wholly made by us. It is
necessary also because it is so notorious as to be a public
scandal, that there is great fraud in the metal quality of
both gold and silver cases as now generally sold. We have
demonstrated by frequent assays that many gold and
silver cases offered in the market are debased from 10 to 20
per cent from the quality they assume to be. This is a fraud
upon the purchaser, and accounts for the low price at which
such cased watches have been sold.

"Eighteen carat" gold, such as the Waltham cases are
made of, is as nearly pure gold as can be made and be dura-
ble. It contains 750-1000 of pure gold, and 250-1000 of alloy.

Sterling Silver (English Govt. standard) contains 925-1000
of pure silver, and 75-1000 of alloy. The Waltham Watches
will always be found up to the standard represented.

Terms—Publishers' Notices, etc.

For One or Two Subscriptions, One Year, the price will hereafter be (post-free) \$1.50 each, instead of \$1.60.
[ALL POST FREE.]

Three Subscribers one year. \$1, or \$1.33 each.
Four Subscribers one year. \$5, or \$1.25 each.
Five Subscribers one year. \$6, or \$1.20 each.
Six Subscribers one year. \$7, or \$1.17 each.
Seven Subscribers one year. \$8, or \$1.14 each.
Eight Subscribers one year. \$9, or \$1.12 each.

Ten or more Subscribers, post-free,
Only \$1 each.

[A free copy to sender of club of 20 at \$1 each.]

Single Numbers sent, postpaid, for 15 cents each. Specimen numbers for examination sent, postpaid, for 10 cents each. Subscriptions can begin at any time.

The Above Terms are for the United States and Territories, and British America. Add 14 cents extra per year for papers delivered by mail in N. Y. City, and for copies sent outside of the United States and British America, except to Africa, Brazil, British Honduras, the East Indies, and Mexico. For the last named five countries the extra charge is 38 cts. per year, to cover extra postage, and Single Numbers, 17 cents, post-paid. Remittances, payable to Order of Orange Judd Company, may be sent in form of Checks or Drafts on N. Y. City Banks or Bankers; or P. O. Money Orders; or in Registered Letters, such letters to have the money enclosed in the presence of the Postmaster, and his receipt taken for it, and the postage and registering to be put on in stamps. Money remitted in any one of the above three methods is safe against loss. Bound Volumes from Vol. 16 to 36 inclusive, supplied at \$2 each, or \$2.30 if to be sent by mail. Sets of numbers sent to the office will be bound in our regular style for 75 cents (30 cents extra if to be returned by mail). Missing numbers in such volumes supplied at 10 cents each.—Any Numbers of the paper issued for 21 years past, sent post paid for 15 cents each; or any full year, sent unbound, for \$1.50.—Clubs of Subscribers can be increased at any time, at the club rates, if new members begin at same date as the original club.

This is for Every Reader

OF THE
American Agriculturist.

We invite Every Reader to examine carefully page 439, and onward: In accordance with the hard times, and the low prices, generally, we have provided a supply of very good articles and placed them on such unprecedented Low Terms (terms never possible before) that every one who reads this will be able to very easily secure one or more desirable articles without cost. For example, there are eight articles, any one of which is available, free, to the person sending only one subscription besides his or her own at the regular single rate. There are Twenty articles requiring only two other names. There are fifteen articles requiring only three other names. And so on—the number of names decreasing in proportion to the increasing value of the articles. Please read carefully all that is said in the first two columns of page 439; also the items on this and next page on "Holiday Presents" and Extra Numbers Free.

To Get HOLIDAY PRESENTS, at little or no expense, will be an easy matter for very many of our readers, as, on consulting pages 439-448, it will be seen that by sending a very few names of subscribers, many of the smaller articles may be obtained free. There are, for example, Twenty different things sold at and worth a Dollar each, that go free to those who send only 3 subscribers at the regular \$1.50 subscription rate, or five at the four-club rate of \$1.25 each.—These Articles can be got at once, and be all ready for the holidays.—All new subscribers sent in these premium clubs are entered on our books at once to the end of 1879, and they receive any numbers issued this year, after their names come in, Without Extra Charge. So it is their gain to subscribe immediately, and that will help those making up premium lists. BUT, besides the Dollar articles, there are many more costly and valuable articles to be had for a corresponding number of subscriptions. The best way is to send on subscriptions as fast as they can be got, and then along early in December send for the article that your list of names up to that time calls for, allowing plenty of time for it to reach you before the holidays, including accidents, or any chance delays in its delivery.

MUCH USEFUL INFORMATION, and Answers to many inquiries, will be found on pages 439 to 448, in the illustrations and descriptions of various articles and implements, and it is well to preserve this number for future reference—for a year to come. Many of the articles are those often inquired after by our readers. It will be seen that an opportunity is given to all to get one or more of them without cost—and very easily too.

PREMIUM ARTICLES FOR SALE

To Our Readers.

The articles described on pages 439 to 448, are intended for *premiums* or *presents* to those who gather and forward subscriptions, and until last year, were confined solely to this. But in response to many requests, always coming, we have arranged to supply most of the articles described, to such of our readers as may not desire, or may not have the opportunity, to obtain them through the subscription offers. This applies to *all* our readers, and especially to those living remote from regular dealers, and to those who may wish our judgment in selecting and guaranteeing the good quality of the articles. A note will be found at the end of the description of each article that can be so supplied, stating the cash price; or the price may be found in the table on page 439. A paragraph at the bottom of that table, tells which articles are delivered with postage or express charges *prepaid*.

Extra Numbers Free.

All new Subscribers now received for 1879, are entered at once on the mail books, to receive the paper up to the end of 1879 for only one year's subscription price. We print a lot of extra copies of this **November Number**, and for the first 8 or 10 days of the month will forward one of these to new names received, if the extra copies hold out so long. After these are exhausted, or after November 10, new subscribers for 1879 coming in during November, will receive the December number *free*. This offer will aid those beginning at once to make up Premium Clubs.

THE EDITORS call special attention to the Publishers' announcements on pages 439-448. It will be well to read through those pages. As Editors, we promise to spare no effort to meet the wishes of the Publishers, to have the *American Agriculturist* for the coming year exceedingly valuable to **ALL** its readers. We trust they will agree with us, that a Journal like this, going into a family for a year, will not only exert a healthful influence in stimulating thought and improvement, and thus elevate the mind standard of all cultivators of the soil, and of others too; but that it will also help guard against errors, against imposition, and assist all to make their labor more profitable. With this view, we invite all to lend a kind influence in making this journal even more widely known, and in drawing to it as readers, many who are now without its visits. This we ask as a friendly favor, aside from the rewards which the Publishers offer on an unusually liberal scale.

The Microscope Still Available.—The offer of the *American Agriculturist Microscope*, extended all through the year 1878. Every subscriber entered on our books, prior to Dec. 31, is entitled to one, on payment of 40 cents if it be taken at the office, or 60 cents if the microscope is to be delivered free anywhere in the United States or Territories. The price to non-subscribers is reduced to \$1.00 at the office, or \$1.20 if delivered free. No other Microscope equals it in value for the price.

The "American Agriculturist" for the West.—Though this journal has now, as for many years past, a very large circulation all over the West, and is highly prized there, we propose to give more attention to the special features of prairie farming and Western culture generally, for two reasons. *First*, for the benefit of our Western readers themselves, and *second*, because there is a remarkable increased interest in farming in the West by people all over the Eastern States, and they are anxious to know all about it. The hard times, affecting especially the manufacturing and mining districts of the older States, have turned the attention of hundreds of thousands to the broad, fertile, and still unoccupied fields between the Mississippi and the Pacific Ocean. As noted elsewhere, one of our staff is now on an extended Western tour, accompanied by an artist. Some of his general notes are given on pages 410-411, and we are making arrangements for new editorial associates living and working on the Western fields. This will not diminish, but rather increase the value of the paper to all the older regions of the country. Indeed, the principles of cultivating, of feeding, of fruit-growing, of mechanics applied to implements, are the same everywhere. The specific practices applying only

to particular localities are few, and every section of the country can learn something useful from every other. This Journal, as indicated by its name, is for *America as a whole*, as well as for other lands.

Every German Cultivator and Laborer on the Farm, or in the Garden, OUGHT to have the *German American Agriculturist*, and thousands of new subscribers are taking it this year. It contains not only the Engravings and all the essential reading matter of the American edition, but an additional *Special German Department*, edited by the Hon. Frederiek Munch, of Missouri, a skillful, successful cultivator and excellent writer. No other German Agricultural or Horticultural Journal in America has been so long issued, or contains so much useful information and so many engravings.

The "Defiance" Spring Wheat is coming to the front, if the trials, so far reported, in competition for the prizes offered by Messrs. B. K. Bliss & Sons, are a fair indication. We condense a few of the reports—all sworn statements: (1) California—16 ounces sown in drills 8 inches apart; $\frac{1}{64}$ of an acre area; 3 tons barnyard manure applied; yield, 316 lbs., equal to 337 bushels per acre. (2) Colorado—16 ounces sown; yield, 240 lbs. (3) Colorado—14 ounces sown; area, 29x137 ft.: yield, 290 lbs. (4) Vermont—16 ounces sown thickly on damp land; yield, 50 lbs., some of the heads 7 inches long. These reports show that this is a superior variety of spring wheat, and also what is possible in wheat yields under the highest cultivation. Reference to page 447 will show that the Publishers have secured a quantity of this valuable variety of spring wheat for distribution.

A Whipple-Tree Guide is advertised by the Semple & Birge Manufacturing Company of St. Louis, Mo., which appears to be valuable for wagons and other implements drawn by two horses. It consists of chains connecting the double-tree directly with the front axle, for the purpose of taking the strain of an obstruction to one of the wheels and dividing it between the horses, instead of allowing the pole and an undue proportion of the strain to press upon one horse. This "Guide" has been adopted by many large Western wagon manufacturers.

The American Veterinary College opened Oct. 5th with a new class of 20, and indications of a total attendance this year of about 50 students, an increase of 60 per cent over the last session. We are glad to see this evidence of a growing interest in veterinary education.

Jersey-Ayrshire Sale.—Mr. Thomas Fitch, New London, Conn., announces a sale of the cross-bred Jersey-Ayrshire stock, Nov. 7th. See page 437 for particulars.

Saint Nicholas.—After the failure of so many journals for young people, it was a great risk for Scribner & Co., to undertake a first-class children's monthly. But in selecting Mrs. Mary Mapes Dodge as Editor, success was sure to follow. If there was ever a person adapted to fill a particular place, it is this lady in her fitness to fill the position she now occupies. Mrs. Dodge's great success is due to the fact that—every other qualification being present—her heart (and a large one it is), is in her work. To say that "St. Nicholas" is the best children's journal now published, is to say what every one familiar with it knows. If there is any way of making it better than it now is, Mrs. Dodge is just the one to find it out—and then to "go and do it."

Scribner's Monthly is always a welcome visitor. It is a curious fact, that although there are some half dozen of what may be regarded as first-class monthly magazines, they are essentially unlike, each having its peculiar features. Scribner's, while not neglecting general literature, including fiction, always has one or more articles showing how things are done, which are instructive as well as pleasing. An example of what we mean, is found in the last (October) number, in the article on "The Art Schools of New York," in which the reader is taken "behind the scenes" and shown the various methods of instruction. In the matter of engravings, Scribner, if equalled, is not excelled by any other journal, many of its illustrations being wonderful for their beauty. We are glad to learn that this excellent monthly meets with the success it so well deserves.

Pneumonia in a Heifer.—"M. S. G." Morristown, N. J. Pneumonia is now frequent among cattle in parts of New Jersey, and it is probable that your heifer is suffering from it. On the first attack take special care of the animal; protect from heat as well as cold; provide pure air and clean stable; nurse well; wrap a rug around the fore part of the body, and give warm slops of linseed or oatmeal. If fever is present give one ounce of saltpetre in a bran mash. If worse symptoms occur, either call in a veterinary surgeon, or follow the directions given in some good veterinary work.

The Chicago Fat Stock Show, to be held by the Illinois State Board of Agriculture, at Chicago, Dec. 2d to 7th, promises to be an interesting exhibition, and a profitable one for the farmers. In view of the increasing interest in and demand for meat products, such shows as this are of special importance, and deserve success. Cattle, sheep, swine, and poultry are included, and the premiums are liberal and numerous. Most of the railroads centering at Chicago will make reductions in freight rates for the occasion.

"Twenty-five Cent Dinners for Families of Six," by Miss Juliet Corson, Sup't of the N. Y. Cooking School.—Most of us have learned by experience, that a costly dinner is not necessarily a good one, and it is equally true that a cheap dinner need not be a poor one. Miss Corson, in her hook with the above title, undertakes to show that a good dinner can be made for that sum, not only for one person, but for a family of six, comprising the two parents and four children of the usual ages and appetites. To provide a dinner for this price, not only must Miss Corson's directions for cooking it be followed, but also those for buying the materials. Miss Corson is doing a good work; while she teaches the wives and daughters of the wealthy to make *Poulet a la Marengo* and *Omelet Soufflee*, she does not forget that the wives and children of the laboring men need to be taught how to make a Beefsteak Pie or a good Pudding. Some months ago, we gave a notice of Miss C.'s, "Twenty-five Cent Dinners," and later experience with the work has increased our appreciation of it. The object of the work is to teach the wife of the laboring man and of others with a small income, how to live well. To this end, she shows how to buy and how to cook the materials when bought, in the most economical manner. It is poor economy to put a piece of meat in the oven and dry it, to three-fourths or two-thirds of its bulk. There are much better methods pointed out in this little work. European nations have long ago learned the value of soups and broths, and there is no reason why these should not be common among us; the introduction of these is one of the important features of this work. Another is the introduction of kinds of food that, while cheap and nutritious, can be served in various styles, and should be oftener seen upon the tables of the more prosperous, as well as of those who count the cost. Among these, are split peas, lentils and macaroni—articles affording the most concentrated nourishment at a low price, but with us regarded as luxuries for the wealthy, rather than every-day food for everybody. So well convinced are we of the utility of Miss Corson's "Twenty-five Cent Dinners," that we have arranged with her for the publication of an enlarged edition; it is now in preparation, will be issued shortly, and sent by mail, post-paid, for 25c. We can commend this little work to *every family*, especially to farmers' families, who will find here the methods of cooking the articles of food furnished by the farm, in a variety of acceptable forms. Most farmers have a great abundance, but their tables lack variety, and to this end, Miss Corson's little work will be found full of useful hints.

Wire Mattresses.—Many years ago we received one of the first wire mattresses that were made. We found it a great comfort, and gradually all the beds were changed from the old style with wooden slats to the comfort-giving wire substitute. We regard the wire mattress as one of the great improvements of the century in the way of house-furnishing. Since the first attempts, great improvements have been made, and we find our latest investment in one of the mattresses made by the National Wire Mattress Co., New Britain, Conn., to be vastly better than the earlier articles of this kind.

Silver Plate.—There are some articles, the quality of which can not be judged of by mere inspection, and prominent among these is silver plate. The loss by careless servants, and the temptation to thieves is so great, that many families who can well afford solid silver for their table ware, use plated ware in preference. Burglars are good judges, and they will not be at the trouble of carrying off plated articles. In purchasing such ware, the most shrewd can not distinguish between that which has a mere film of silver and that which has a good, serviceable coating; the sole reliance must be upon the reputation of the maker. The New England Silver Plate Co., New Haven, have the reputation of making articles that are just what they represent them to be—as good as can be furnished at the price.

The Rubber-cushioned Axle is a simple contrivance by which the axle is cushioned within the hub with rubber. Its object is to prevent the jarring and noise produced when the axle is in direct contact with the hub, and is used by some of the first carriage makers in the country. The testimony of well known persons who have this invention in use, would seem to demonstrate that it will do what is claimed for it.

American AGRICULTURIST.

NEW YORK, NOVEMBER, 1878.

Thanksgiving.

Thanksgiving day was instituted by the Pilgrims at Plymouth as a day of fasting, thanksgiving, and prayer, in memory of the bountiful crops gathered at their first harvest, in 1621. Occasional days of thanksgiving were held from then until 1680, when it became an annual custom in Massachusetts, and they were frequent in other colonies, often at different seasons and for various purposes, as for the safe arrival of ships after dangerous voyages,

since which time the President has issued such a proclamation annually, supplemented by one from the Governors of many of the States. Year by year the day is becoming a truly national festival, and especially where New England blood and sentiment have made themselves manifest. It is a day, too, which should become national in every sense, as no other nation, as a nation, has greater reason to be thankful to the Giver of all good, for liberty and progress, than ours. One of the most beautiful features of Thanksgiving Day is the gathering of scattered members of the family at the old home; and it is this "coming home for thanksgiving" which our artist has so well portrayed in the engraving. Husking, though mainly over in New England, is common in the latitude of Pennsylvania to Kansas, and further south. We hope this festival will be observed this year at the home of every member of the great *American Agriculturist* family,

it can be performed comfortably and cheaply. Many are getting it husked for 3 cents a bushel, which is cheaper than for the owner to do it himself when he has plowing or draining to do. By and by no one can afford to husk at this price, as the days will be shorter and the weather colder.

Stacking Corn-fodder.—Fodder is damaged by exposure in the shock. It should be stacked at once; it keeps best in small stacks—say 12 feet wide and 16 feet high to the peak. Put ventilators made of rails in the center to prevent heating and moulding.

Seed Corn.—If a full supply was not selected when cutting, it should be done at the husking. (See article on "Selecting Seed Corn," page 412.)

Root Crops.—Gather before injured by frosts. Mangels, being tender skinned, need to be handled with care. The tops make good feed for cows if given in quantities of not more than half a bushel

COMING HOME FOR THANKSGIVING.

or for victories over the Indians. Thanksgiving Day was a national institution throughout the revolutionary war; but there was no national appointment after the general thanksgiving for peace in 1784, until President Washington recommended one in 1789, for the adoption of the Constitution. There were other official appointments for national thanksgiving, in 1795 for the suppression of an insurrection, and in 1815 for the successful termination of the second war with Great Britain. It early became one of the most prominent holidays throughout New England; in other sections it was frequently observed locally, and by some religious bodies. The Governor of New York has annually recommended a day of thanksgiving since 1817. Proclamations for the observance of the day were made by the Governor of Virginia in 1855, and in eight Southern States in 1858. President Lincoln issued proclamations recommending days of special thanksgiving for victories in 1862-3, and in 1863-4 for the annual observance of the day by the nation;

whether in city, village, or country. It is distinctly an American institution, and savors of the peculiar puritan character in its best phase, which deserves to be preserved, and to spread into every section where contentment, happiness, and the ties of family and friendship prevail, and where they are desired to be perpetuated in the coming generations.

Hints for Work.

Secure the Crops.—Many farmers, as well as other people, are always behind hand. They go to large expense and much labor to produce crops, and then permit them to waste. There are potatoes yet ungathered, corn unhusked, badly-shocked corn-stalks exposed to the weather, potatoes and fruit daily depreciating, etc., etc. A dollar paid for extra help now is better than losing ten dollars by delay in securing or properly storing the crop.

Corn Husking is better to be done at once, when

at a time, but they should be wilted at least 24 hours before feeding. Pitting is a cheap and effective method of preserving them. (See "Talks on Farm Crops," on keeping roots, etc., page 415.)

Harvesting Turnips may be done quickly by topping them with a sharp hoe, plowing a furrow away from the roots, and then dragging a harrow across the rows, so as to tear them out of the ground towards the furrow. A slight bruising will be little damage as compared with the cheapness of the method. They may be rapidly thrown into wagons with manure forks. Turnips may remain in the ground until there is danger of their being frozen in. Light frosts do not injure them.

Plowing should be engaged in at every opportunity. Every day's work thus done helps forward the labors of the busy spring time, and opens the ground to the ameliorating effects of freezing.

Top-dressing Fall Grain should be done without delay. If no barn-yard manure is at hand, some

commercial fertilizer should be applied, except on very fertile or previously manured ground.

Draining.—There is no better season for this than the present. It may be many years before the work can be done as cheaply as now. It is a most profitable way of investing money to drain *where it is needed*, as it is on very many soils.

Leaves from the Woods furnish excellent litter. It is the safest bedding for brood sows, and for the lambing pens, as the weak young animals are not entangled in it as in straw. Leaves should be raked up in heaps in the woods, or stacked, for drawing home at leisure.

Swamps that have been cleared may be burned over now, where necessary. The fire should be begun on the side away from the wind, that it may be kept under control and safe. When setting fire to a clearing, notify the neighbors, else you may be liable for damages to their property.

Rubbish of All Kinds, not adapted to the compost heap, should be burned. No weeds in seed should go into a compost. Few seeds are killed by any heat that can be produced by fermenting manure.

Repairing of Buildings is to be attended to: windows glazed, doors tightened, roofs made whole, and ventilators put where needed. It is a good time for painting out-buildings. A mixture of boiled and raw linseed oil, and mineral paint of a dark red color, is cheap, serviceable, and attractive.

The Barn-yard should be cleaned up, and a heap made of all the manure in it. This will ferment, and be the nucleus for a large pile of well decomposed material in spring. A quantity of warm, moist dung will soon start a heat in a new pile, and will act as a leaven to spread the fermentation, which may be kept up through the coldest weather.

Live Stock needs special care just now. The weather is changeable, and protection from sudden storms is imperative. Good food, plenty of pure water, cleanliness, dry bedding, and abundance of pure air, will promote comfort and health.

Working Horses.—New grain is not wholesome for horses, especially new corn. Let horses that are still at pasture have some dry food at least once a day to prepare them for the regular winter feeding.

Weaned Colts should have a pint of bruised oats daily, and if the coat is rough, a little linseed meal. It is time to begin handling, and training them to wear a halter, to lead, and be groomed.

Feeding.—Grain is cheap, and it will pay to feed all kinds of stock liberally. With corn at \$12 to \$16 a ton, and oats at \$20, hay is dear at half these prices. By feeding straw, with increased rations of ground corn and oats mixed with bran, an excellent substitute may be made for hay, which may, perhaps, then be sold at a profit.

Milking Cows are now taken up from grass, well fed, and permitted to take on some fat, which will enable them to stand the coming cold weather with comfort. A cow in full milk ought to eat, at each meal, half a bushel of moistened cut clover, hay, or corn-fodder, and 3 quarts of mixed corn and oat-meal, and middlings or bran, besides a picking of dry hay at noon. A safe rule is to feed a cow all she will eat up clean.

Calves should be comfortably housed at night, and receive regular rations of feed. One-third of a cow's allowance is not too much for a growing calf.

Sheep.—As soon as the teeth begin to fail, the animal—whatever it may be—is past a profitable age. Sheep go down hill fast. Weed out the flocks, and keep only thrifty sheep over the winter.

The Lambs should be protected from cold storms, if older sheep have to rough it. As long as the skin is dry, a sheep can stand a good deal of exposure, but lambs can not. These should now be separated and penned by themselves.

Rams, for service, are kept up in the day-time and admitted to the flock at night. The ewes should be marked and numbered. If the ram's breast is smeared with a mixture of Venetian red and oil, the ewes that are served will be marked. No careful shepherd will let this matter go at hazard, as it is necessary to know when lambs are

expected in the spring. A large, full-grown ram needs a quart of grain a day, and can serve 50 ewes.

Fattening Pigs ought to be pushed rapidly now. The profit is in selling pork early, thus saving a month of the most expensive feeding, when half the food goes to keeping up warmth in the body instead of into fat. With corn at present rates, pork, though low, is still profitable.

Young Pigs.—Leaves are the best bedding. A stove in the piggy, and a warm blanket for the sow, may save a litter in cold weather. In arranging a piggy this should be considered.

Sundry Matters.—Wood cut and split now will be dry in a month. Dry wood, neatly piled under shelter, is a family peace preserver.... Clean up and burn all rubbish; bones, old barrel hoops, boots, etc., should be thus disposed of.... Put empty barrels and boxes, etc., that are of value, in neat piles, and cover them.... Get ready for winter and the snow by leaving nothing "lying about loose.".... Clean out the cellars, drains, and gutters.... Get up timber for making posts and rails in stormy weather.... Be careful of lights. The safest oil is a kerosene which will not take fire and explode if the lamp is upset. Avoid low-priced oils, and use only the best, which give the most light for the money, and are cheapest as well as safest. Keep insured, and then be careful.

Notes for the Orchard and Garden.

While our spring is so brief—there being but a leap, as it were, from winter to summer—this is more than compensated for in the character of our autumn, which allows us to do much of what is regarded as spring, or preparatory work, well in advance. So gradual is usually the approach of winter, so even for the most part is the weather, that our Notes at this time must cover several weeks, if not months, as it is not rare that the tasks suited to October may be carried well into December.

Orchard and Nursery.

It would seem to go without saying, that in a season of abundance, poor fruit has a poor chance in the market—and it seems to many needless repetition to insist that it will pay to assort the fruit. We usually advise making three grades, first and second for market, and a third to be used up at home. This year, two grades are enough: the very best for market, and all the rest to be left at home, as this year "seconds" will not pay expenses.

Make all Snug for Winter.—Fences and gates, especially of a young orchard, need to be cattle-proof. Surface drains are to be made to let off standing water. If the orchard needs under-draining, there will be no better time to do it than now.

A Mound of Earth around the base of the trunk will be of great service to young trees, especially those planted last spring or this fall; this may be 12 to 20 inches high, made steep and smooth; reject all sods and rubbish, and lay it up solid. This will support the tree better than stakes as usually put in, and be of great service in keeping off mice.

Rabbits may be trapped; where they are abundant, blood is found the best application to keep them off, a sprinkling with a swab being all that is needed. Where blood is not available, liver, or bloody meat, may be rubbed on the trunks; rabbits have a great distaste for animal substances, and whatever will smear the tree with blood or meat will answer. A few trees may be protected by binding pieces of lath, cornstalks, or tarred paper around the tree, using wire to keep them in place.

Cider and Vinegar.—The best cider is made in cool weather, as fermentation goes on slowly; for vinegar it makes no difference. See page 418.

To Keep Fruit, the lowest temperature short of freezing, and unchanged, is required. In mild weather, open the fruit cellar at night, and close it very early in the morning. Fruit gives off, in ripening, a large amount of carbonic acid, which helps retard the ripening; but in fruit cellars under dwellings, this should be carried off by a ventilator, as it is detrimental to the health of the family.

Planting may be done whenever the weather suits, but not when the air is freezing cold, or the soil is full of icy clods. In former Notes, directions for late planting and for heeling-in, are given.

Cions may be cut as soon as the leaves are off; label and preserve in sand, or, what is better, fresh saw-dust. Keep in a cool cellar or pit.

Stocks for Root-grafting should be taken up before the ground freezes, assorted, tied in convenient bundles and placed in the cellar or in a pit, with their roots well covered with earth, or set in boxes with an abundance of soil among the roots.

Seeds for those who raise their own stocks should be secured. Apple seed is separated from pomace; small lots may be managed by pounding the pomace in a barrel with water, and washing off the pulp; dry the seed well before putting it away. Stones of peaches and cherries need to be exposed to freezing and thawing in boxes of sand or soil.

Various Matters.—Clear up rubbish in the orchard.... Commence the war on insects by removing the clusters of eggs found near the ends of the twigs.... Pick up all refuse fruit and give to the pigs, to dispose of what insects may be within.

Fruit Garden.

Dwarf Pear and other fruit trees in the garden need the same general care as trees in the orchard; the trees being mostly low, they can receive more close attention than large ones.

Late Pears.—Winter varieties need the same treatment as apples: keep as cool as possible until wanted for use or for market, when a few days in a warm room will bring them into eating condition. Earlier sorts should be on shelves in a fruit-room where their progress may be watched.

Protection often defeats its object, and becomes smothering when done too soon. The covering need not be put upon strawberries until the surface of the ground has frozen; the covering of tender raspberries with earth should be delayed until there is a prospect of freezing weather.

Blackberries and Raspberries may be planted if the weather allows. If it is desired to propagate these, make cuttings of the roots, taking those the size of a quill or larger; cut these into pieces one to three inches long; place them in a box with an abundance of sand or sandy earth, and keep them in a cool cellar. In large quantities they are buried; having nearly filled the box with root-cuttings and sand, put some straw on top, and nail on some strips for a cover. Bury the box *upside down* where water will not stand, with earth enough over it to prevent freezing. In spring the roots will be found callused and with buds, and may be set out in nursery rows. Plants may be had from suckers, but they are not so good as those raised from root-cuttings.... The sooner, after the leaves are off that

Grape Vines are pruned, the better. Young vines set last spring should bear next year one or two shoots, according to their strength; if the present growth is half an inch thick, two shoots may grow next year; if smaller, have but one shoot. Cut the present cane back, leaving a few more buds than shoots are to grow; this is to guard against accidents. Older vines are to be pruned according to the method of training adopted for the vineyard. It is difficult to tell how to treat

Old and Neglected Vines, as no two are alike, and each must be pruned according to its present condition. All the growth of next year will come from the buds now on the vine. Each bud—if conditions are favorable—will push out a shoot, and on that, and not on the canes now present, will the fruit be borne. By keeping this in mind, and with some idea of what is wanted of the vine, leave buds enough to produce the desired shoots, and cut all the rest away. The novice is far more likely to leave too much than to cut away too much.

Propagating the Grape is a very easy matter with most varieties, and can be done by any one, while a few, like the Delaware and Norton's Virginia, require a propagating house, though, in a small way, they may be multiplied by layers in spring. Make cuttings from the prunings, using only the canes of the past summer's growth, cut them into pieces

of two or more buds, according to length of joints; tie in bundles of 25 or 50, the tops all one way, label, and cover with earth or damp moss in the cellar.

"*A new Method of Propagating*," described last month on p. 382, is excellent, and we commend it to those who wish to raise a sufficient number of vines to warrant the moderate trouble required; such difficult subjects as the Delaware will succeed with this. Quinces, currants, and gooseberries, may be treated in the same manner, though

Currants and Gooseberries root so readily, if the cuttings be put in now, that it is not necessary.

Kitchen and Market Garden.

The Notes on fall work have been so full for the past two months, that we refer to those for the main items, adding a few not given there.

Asparagus.—Cut and hum the tops to prevent the seeds from producing weeds, as they are sure to do if scattered or put into the compost heaps, and give the bed a generous covering of coarse manure.

Rhubarb.—If a new bed is desired, make it at once, using a piece of an old root with a bud attached. Place them 4x4 feet, giving each an abundance of old manure well spaded in. Where there is an abundance, take up some roots for forcing, putting them in a box of earth in a cool cellar. In February, set the roots under the bench of a greenhouse, or put some in a harrel with earth to cover well, and set this in a warm place in the kitchen, or near a furnace in the cellar, keep covered, and soon long and tender stalks will appear.

Spinach is safer if covered slightly, putting more straw or marsh hay around than over the plants.

Cold Frames.—Keep the plants dormant, covering only at night except in freezing weather, and then ventilate in the warm part of the day.

Celery in the climate of New York is all stored by the middle or last of the month; in colder localities it must be done earlier. A trench is dug in a dry place, a foot wide, deep enough to bring the tops level with the ground, and as long as needed, or two or more may be made side by side. Set in the plants as close as they will stand, putting no earth among them. Have straw, leaves, or other covering at hand; cover slightly the first cold spell, and as the cold increases, add more covering until it is a foot thick. If some boards are laid lengthwise over the covering it will make it easier to take out the celery if there is snow on the ground. A small quantity of it may be stored in

Boxes in a Cool Cellar; boxes 9 inches wide with sides as high as the plants and as long as convenient, are provided; a few inches of soil are placed in the bottom, and the celery packed in them as in the trenches. Even when the main crop is stored in trenches, a box or two in the cellar will be useful for keeping the immediate supply—of course this will not answer where there is a furnace.

Cabbages.—The general crop is set head down in two rows upon a level spot, and before the earth freezes it is thrown over the cabbages to the depth of two inches. A small lot, or the immediate supply, may be set in trenches, and covered with leaves, straw, or marsh hay, and boards put over this.

Soft Cabbages if planted out in a trench, covered with boards to shed rain, and some litter over these, will come out in spring in fine condition, and are preferred by many to those headed as usual.

Covering with Earth or Sand will keep roots of all kinds in excellent condition, as it prevents wilting. The supply for present use may be kept in the house cellar if placed in boxes or barrels and thus covered, without causing any unpleasant odor.

Parsley where there is no greenhouse may be had in the kitchen. Take a keg of convenient size and bore the sides full of inch and a half holes, 3 or 4 inches apart; take up the parsley roots, removing all the larger leaves and put the crown of each at one of these holes, from the inside, the roots pointing towards the center of the keg. Fill in with good soil as the roots are put in, and set several upright at the top. If this is kept in a sunny window and properly watered, it will give a supply of parsley and make a cheerful ornament besides.

Odds and Ends.—If seeds are saved, clean them, label, and put away in a cool dry place.... Do whatever will help forward the work in spring, plowing or spading may be done whenever the soil is fit to work, leaving the surface rough.... Have tools and machines that are put away for the winter, thoroughly cleaned, and make needed repairs at once.

Flower Garden and Lawn.

In mild autumn weather the grass will make a close stocky growth in preparation for winter, and the lawn should not be mown too late. The lawn should go into winter quarters with a fair length of grass to serve as a mulch. Those who use manure as a top-dressing should apply only that which is so thoroughly composted, that there is no possibility of bringing in weed-seeds. It may be put out at any convenient time.

Perennial Weeds, such as plantains, docks, etc., should be eradicated from the lawn, while the soil is soft from the late rains. A long chisel-like implement, sharp at the lower edge, is useful in cutting or loosening roots well below the surface, and it leaves no mark in the sod.

Winter Gardening.—Those who wish to make the most of their gardens, keep a stock of small evergreens in pots, in reserve. These are plunged in some convenient place the rest of the year, and after the frost has killed the plants in the show beds, they are filled with the potted evergreens.

Dwarf Evergreens are especially suited to this purpose, and there are now so many of these that a selection may be made comprising a pleasing variety in form and color. We have often mentioned *Retinispora plumosa aurea* as a most manageable and showy plant. It is well suited to pot culture, and a bed of that alone would form a bright spot in winter, though it is more effective in contrast with some very dark evergreens. The dwarf Arbor Vitæ, and some of the low varieties of Norway Spruce, such as *conica*, are excellent for such work.

Bulbs that are to be planted, and those that are to be lifted, were mentioned in last month's Notes.

Preparatory and Final work, such as taking up of tender plants, protecting such as need it, the transplanting of shrubs, in mild localities, and other matters of the kind hinted in former months, should be finished up at once. It is a good time to make new beds, and new paths or drives may be laid.

Leaves are too valuable to allow them to be blown about and scattered. Gather those from the roadside that would be otherwise lost, and lay in a stock from the woods. They are the natural covering for herbaceous plants, and if more are collected than are wanted for covering, they make excellent hedging in the stable and from there a rich addition to the manure heap.

Snow Plows should be provided; one for a horse or horses to clear roads, and a hand plow for paths, used in time, will save much work with shovels.

Greenhouse and Window Plants.

Knowing that those who have greenhouses, even of moderate size, usually have one or more works as a guide in the treatment of the plants, we give more space to window plants than to those in the greenhouse.... Plants must have

A *Gradual Change* from the free air and the alternation of warm days and cool nights to the close air, and often uniform temperature of the living room. We should have much fewer complaints of failure with house plants, were it generally known that they require less heat in the dark than they do in the light, and that the night temperature should be at least 15 degrees less than that of the day.... The observance of

A *Few Simple Rules* will promote success with house plants. Always let the night temperature be 15° lower than that of the day. Change the air of the room thoroughly every day without allowing a cold current of air to fall upon the plants; this may often be done through an adjoining room. Water when water is needed, and only then; it is better to let a plant suffer for a little—as shown by the flagging of the leaves—than to over-water and

keep, as too many do, the soil in the pots in the condition of mud. Avoid dust as far as possible, by covering the plants while sweeping; but with all care they will get dusty; those with smooth leaves may be sponged once a week, going over each leaf with a soft sponge, or soft cloth, dampened with blood-warm water.

Bulbs.—No plants give more satisfaction in window culture than the Holland Bulbs. Hyacinths and the Polyanthus Narcissus are the most popular, because, besides their bright colors, they are delightfully fragrant. Tulips, Crocuses, etc., are showy, but lack odor. Bulbs may be grown in sand, moss, sponge, or in water, but such methods are merely fanciful, and do not give a strong bloom like those in rich soil in pots. Equal parts of good garden soil, old cow-manure and sand, will give a good mixture. Pot the bulbs at once—it should have been done last month—and set in a dark cellar until roots are formed.

"*Winter Greeneries at Home*" is the title of the best work on window culture that we know of. It is also the title of what every one may have, with a little care. If our rooms are not suited to flowers, there are none that will not admit of abundant green. There can be no more beautiful decoration to a room, however humble, or however grand, than green foliage. The best of "Winter Greeneries" is Ivy—of course the true or "European"—whether "English," "Scotch," or "Irish," the same thing being often called by all these names. A note on page 423 gives the essential points in treating it.

Insects.—Success in the fight with these depends upon promptness and perseverance. Do not wait until the plants get so bad that in despair you write to ask us what to do. Tobacco water, soap-suds, and a soft tooth-brush, a pointed stick for the Mealy Bug, with the thumb and finger applied wherever "life is seen," are sufficient.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, from our record kept daily during the year, show at a glance the transactions for the month ending Oct. 12th, 1878, and for the corresponding period last year.

Gold has been up to 101½, and down to 100½, closing Oct. 12 at 101½ as against 100½ on Sept. 12; 100½ on Aug. 12; 100½ on July 13; 100½ on June 13; 100½ on May 13; 100½ on April 17; 102½ on Jan. 12; 103 on Dec. 12; 102½ on Nov. 12; 103 on Oct. 12, 1877.... Extensive receipts, sales, and shipments of Breadstuffs have been reported since our last. Prices have been generally depressed, lower, and irregular; holders in most instances having shown much urgency in their offerings. Foreign market advices have been, as a rule, unfavorable, and tended to impede the export movement. Speculation has been quite active, especially in Wheat and Corn, which, how-

ever, left off heavily. In the Wheat line, the features in the dealings have been: the grades of No. 1 White, Nos. 1 and 2 Red, and No. 2 Amber Winter, which grades have been in liberal supply. Spring has not been abundant, but, toward the close, receipts have been on the increase, giving more prominence to this class of stock in the current transactions. The demand for Grain for the French markets, especially for Wheat and Oats, has been again of important proportions. Barley opened buoyantly, and purchases were made at very high figures, but the market wound up heavily, with values quoted decidedly lower and unsettled. Rye has fallen sharply, the offerings gaining on the requirements of buyers, which have been of less magnitude—notably so on export account. Flour suffered severe depression, through the unusually full and urgent offerings, particularly of low and medium extras of winter wheat product....Cotton has been quoted much lower, and at the close weak, on, however, an active movement, chiefly speculative....Provisions have been fairly active, but, in the instance of Hog products, again quoted cheaper and variable....Wool has been moderately active at about former figures, on generally free offerings....Hops have attracted more attention, but have been quoted lower....Tobacco, Naval Stores, and Petroleum in moderate request, and without important alteration as to values....Seeds have been weaker in price, and in moderate demand....Groceries less active, and generally cheaper....Ocean freights fairly active and generally stronger, though leaving off irregularly.

CURRENT WHOLESALE PRICES.

Bees.—The business has been weak, and prices have declined steadily through the month. Large receipts, and a light demand, have reduced the average fully 1/2c. #100, and the rates on low grades twice as much. No improvement is visible as we close our report, and a weak feeling is generally prevalent. Prime cattle to dress, 57 lbs. #100, sold at 10@10 1/2c. #100, with a few extra at 10 1/2c. Poor Western bees sold at 6 1/2c. #100 on an estimate of 55 lbs. to the cwt. Medium varied between these prices.

The prices for the past five weeks were as follows:

WEEK ENDING	Range.	Larger Sales.	Aver.
Sept. 16.....	7 1/2 @ 11 c.	9 @ 10 c.	9 c.
Sept. 23.....	7 @ 11 c.	8 1/2 @ 9 1/2 c.	9 c.
Sept. 30.....	6 1/2 @ 10 1/2 c.	8 @ 9 1/2 c.	8 1/2 c.
Oct. 7.....	5 1/2 @ 10 1/2 c.	7 1/2 @ 9 1/2 c.	8 1/2 c.
Oct. 14.....	6 1/2 @ 10 1/2 c.	7 1/2 @ 9 1/2 c.	8 1/2 c.

Cows.—There has been no change to notice in prices of cows; the supply has been meager and the demand poor. Stock has sold from \$23 for poor cows, up to \$60 for good. \$70 has been paid for extra milkers.

Calves.—Good veals have been in steady demand, and prices have advanced, closing at 5 1/2 @ 7 1/2c. #100 live weight. Grass calves sold at 3c. to 5c., and Buttermilk at 4c. to 4 1/2c. #100 live weight.

Sheep.—The range for sheep have been from 4c. @ 5 1/2c. #100 live, the higher price for good Ohio of 120 lbs average. Prime South-down sold for 5c. #100. New York State lambs sold for 4 1/2c. #100. Dressed mutton sold at 5c. @ 7c. #100.

Swine.—Live hogs have been lower, and the closing prices were 3 1/2 @ 4c. #100. City dressed closed easier and lower at 5 @ 5 1/2c. #100.

The Horse Market.—The scarcity of good horses is very evident, and it is impossible to supply the very limited demand on account of the high views of farmers. This difficulty has operated to greatly limit the business both for the city and the export trade. Prices here are from \$150 to \$500 per head, and at these rates it is useless to expect much to be done under present circumstances.

Prices of Feed.

Barley, per ton.....	\$18.00 @ \$20.00
Middlings, per ton.....	19.00 @ 21.00
Ground Feed, per ton.....	15.00 @ 21.00
Linseed-oil-cake, western, per ton.....	41.00 @ 47.00
Cotton-seed-cake, per ton.....	25.50 @ 40.00
Chandler's Scraps, per lb.....	3 @ 4

Nitrate of Soda, per lb.....	3 1/2 @ 4 1/2
Sulphate of Ammonia (25 per cent.), per lb.....	4 @ 4 1/2
Dried Blood (ammonia 13 per cent) per ton.....	\$40.00 @ 45.00

Col. Wilder's 80th Birth-Day.—We did not suspect that our good friend, Col. Marshall P. Wilder, had reached four-score years, until we saw that the 80th anniversary of his birth, which fell upon Sunday, Sept. 22, had been commemorated on Saturday, the 21st, by a banquet at the Parker House, Boston. This occasion was celebrated by a number of the Mass. Horticultural Society, the Mass. Society for the Promotion of Agriculture, and similar associations with which Col. W. has been long and prominently identified. The account of the proceedings, indicates that many eminent in horticulture, were present to show their respect to the guest. It is the custom to laugh at the "Mutual Admiration" of Boston people, but it is justified by the fact that they have something to admire. What other city can celebrate the 80th anniversary of a life so useful as that of Col. Wilder? Ever since our earliest recollection, he has stood as the example of horticultural progress, always ready to aid and encourage others. He does not, to us, seem to have grown old—he certainly has not in enthusiasm for his pursuits, and we have no doubt that many more birth-days will be honored by his numerous friends.

Bald Tails and Manes.—"S." of Brooklyn, states that he has found an application of kerosene oil to the thin mane and tail of a horse to produce a heavy growth of new hair. It was well rubbed into the skin. Other stimulating applications, such as a weak alcoholic tincture of cantharides, would probably have the same effect. This is generally used to restore a growth of hair.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of room elsewhere.

Large Exports Continue.—The good work of paying our indebtedness to foreign countries is still going on very satisfactorily. It now looks as if we should send abroad this year, of the products of our fields and manufactories, nearly \$300,000,000 more than we import. Two anonymous correspondents have written us, arguing that the most healthful condition of trade, commerce and finances is when there is a pretty even balance of trade all round. If we grant this, as a general rule, it does not apply now. For years, especially during the war, and subsequently, we borrowed largely from Europe, for war expenses, for building railroads, etc. Now we are economizing in expenses, in the consumption of foreign manufactures, and producing and sending abroad all the surplus we can, and thus paying up this indebtedness, and by so much growing richer as a nation. When all our foreign obligations are cancelled, it will be time to discuss balance of trade, etc. While foreign nations held many hundreds of millions of our national, municipal, and railroad bonds, we were likely to be at any time thrown into financial trouble by the sudden return to us of these obligations, whenever extraordinary financial disturbances occurred abroad, through war or other causes. We are now fast oblitterating this element of trouble by cancelling the indebtedness.

A Neat Tethering Pin.—Mr. "I. N. L.," of Cincinnati, who likes to see his handsome Jerseys on the lawn, has devised a tethering pin which we engrave from his sketch. He writes as follows:

"Having tried several different styles, I regard this as 'the thing,' better even than one you illustrated in September. It is made of 1/2-in. round iron, and is 18 in. in height, leaving 12 in. above ground when in place. The loose ring at the center is about 3 in. in diameter. The points are sharpened flat, and are at right angles to each other; this makes them easier to drive, and prevents the points from springing out. There is no chance for an animal to get a line tangled or foul on such a pin. A pin of this style is cheaply made, costing about 25 cts. each, and is much more slightly than an ordinary single pin."

To Gum a Boynton Cross-Cut Saw.—

"Subscriber." A Boynton cross-cut saw will not need gumming when filed properly. File between the teeth when sharpening the saw. The best thing to gum it is an emery wheel, which is kept in every machine shop. If you can do no other way, gum it with a cold chisel. "Gumming" is the technical term for deepening the spaces between the teeth of a cross-cut or other saw.

A Strong Halter for tying bulls or oxen, which

at the same time will not wear the hair from their necks, may be made by taking a stout tie-chain and covering the portion which goes around the neck with leather, as shown in the engraving. The strength of the chain is thus secured, while it is prevented from disfiguring a handsome animal. The covering can be done by any harness maker, or by any one who can use a waxed end.

The Cotton Worm.—Prof. C. V. Riley, Entomologist to the Dept. of Agriculture, called on us on his return from the far South, where he has been to organize a Commission to investigate the cotton worm with something of the thoroughness that marked the work respecting the western locust. The chief field work will be done by Prof.'s A. R. Grote and J. H. Comstock, aided by several local observers in the principal cotton States. Prof. R. discovered what, if known before, has not, to

our knowledge, been published, viz: that certain glands on both the leaves and flowers of the cotton plant exude at the proper season a sweet secretion, that serves as a lure to the moths, and brings them to the plant where they lay their eggs. This suggests a method of trapping the parent insect early in the season. It was found that in the few cases where Paris Green was used to destroy the caterpillars, it was employed in a crude and wasteful manner. When the observations are concluded, we shall, no doubt, have a report of great value to all cotton growers, and incidentally to the whole country.

An Interesting Account of a large French farm, mainly redeemed from what had for hundreds or thousands of years been an uncultivated waste, is given by our special correspondent on page 413. There are hundreds of thousands of acres on Long Island and elsewhere, almost at the doors of New York City, which a free use of capital, intelligently expended, would change to beautiful farms and gardens, at an ultimate large profit to the investor, and to the benefit of the country generally.

Cow-Milking Apparatus—Later Opinion.—In the *American Agriculturist* for September (page 331) we gave somewhat extended remarks expressing our views upon this subject. Numerous inquiries continue to come from our readers, and we have been canvassing the various reports of trials recently received. As stated in September, careful owners of cows may keep one set of well-made tubes on hand for temporary use in cases of badly cracked or severely sore teats; but from all we can gather to this date, we advise not to use any of these implements for ordinary milking. They are unnatural in their action, and several well informed gentlemen of our acquaintance believe that, in their experience, not only have the teats been injured in some instances at least, but the flow of milk has decreased. The end aimed at in allowing them to be advertised in our columns, viz., to obtain a general trial, has been secured, and lest there should injury arise from their use by careless persons, we decide to exclude them from our business columns—at least until such trials as we advised in our former article are made, and until it is positively shown that they are valuable for general use, and that they have no injurious effect upon the flow of milk.

Early Chickens.—"B. K.," Tannton, Mass. An incubator is a good thing if rightly and intelligently managed, and this requires almost constant personal supervision. The larger portion of all the chickens raised in France—the greatest poultry nation of the world—are hatched by incubators. A building on the greenhouse plan is needed to produce chickens in winter, whether hatched by a live hen or a wooden one. With such a house, and conveniences for growing oats and rye under glass to feed them until the spring grass comes, chickens can be raised as well in winter as in summer. A beginner will succeed best by setting hens to come off at the same time the chicks would hatch in the incubator, and then giving each hen 20 to 30 chicks to care for. It is well also to let the incubator hatch even the eggs the hen sits upon, by taking them from her a few days before her time is out; she thus is prevented from crushing the young things before they emerge from the shell. The best fowls for eggs, in the opinion of many, are the Leghorns, white or brown; for meat the Light Brahmas; for both eggs and meat the Plymouth Rocks. The "Poultry World," Hartford, Ct., and the "Poultry Bulletin," 54 Cortland St. New York, are good poultry journals.

Scaly Legs in Fowls.—"Mrs. O.," Ringgold Co., Iowa. As we have often stated, scaly legs in fowls are caused by a parasitic mite which burrows under the skin of the shank and feet. They may be destroyed by applying a mixture of lard and kerosene oil.

Bloody Milk.—"N. C. T.," Warren Co., Pa. Bloody milk is a symptom of congested udder, which soon turns to garget. In a case in the writer's dairy, relief was soon obtained by rubbing the quarters of the udder affected with a mixture of 7 parts of glycerine and 1 part of iodide of potassium; and giving in the feed one ounce of hyposulphite of soda every evening for three days, and after that giving half an ounce of the same every alternate day until the trouble ceased.

Cost of Dairy Barn.—"P. F. H.," N. Y. The cost of the dairy barn shown on page 425, Nov. 1877, depends on the size. The writer has just built a barn for 14 cows, 50 feet long x 24 feet wide and 16 feet high, with dressed floor above, dressed boards outside; all complete at a total cost of six hundred dollars.

Power of a Horse.—"J. A., Jr.," Augusta, Ga. The tractive power of an average horse moving two miles an hour, is equal to 166 pounds. This is steady work. If a horse were fastened to an immovable post by a chain and a spring balance, and were to make a steady pull he could exert double the above power, or

over 300 pounds, but could not maintain it. If forced to his utmost strength in leaping, he would exhibit a force at least equal to his weight, increased by his velocity. A horse is able by a sudden spring to break a chain that would lift a ton or more suspended in the usual way.

Pasturing Hogs on Barley.—"T. A. M.," Queensboro, Ky. The awns or bristles upon ripe barley would probably be dangerous to hogs turned in to feed upon it. But if the barley is pastured when green, it would be quite safe, and almost equally nutritious with the ripe grain, the straw of which would not be eaten. We would turn in the hogs just as the ears begin to show.

A Feed Rack for sheep, which affords double security against waste of fodder, is here illustrated. Figure 1 shows a rack in quite common use, and it is a very convenient one, as it saves much room, is portable, and the box at the bottom allows the feeding of grain. The improved form is represented in figure 2, and consists simply in the addition of an extra frame, hinged to the outer edge of the feed-box on each side;

Fig. 1.—CONVENIENT FEED-RACK FOR SHEEP.

it may be closed and fastened by hook and staple to the main rack when not in use. This frame permits the sheep to eat from the rack, but is an extra guard against the waste of hay, or of grain or roots. It compels the sheep to stand square to the rack, so that there is less

Fig. 2.—FEED-RACK WITH EXTRA FRAME.

crowding, and prevents them from putting their feet into, or fouling the grain-box. The frame on one side of the rack, in figure 2, is represented as closed.

Roup.—"T. W. S.," Spencer, Mass. Fowls exposed to dampness in severe weather, are apt to take cold, which often culminates in Roup. The writer has cured this disease by injecting kerosene into the nostrils by means of a bulb syringe, and then using it to gargle the throat; the latter is effected by holding the throat close enough to prevent swallowing, and after the gargling pouring the liquid out on to the ground. Repeat this once the next day; then feed with hoiled rice and scalded milk, keeping water away for a few days. I. K. F.

Poultry House.—"S. W.," should build in the side hill, sloping south, making the floor 18 inches below the surface on the front side. The foundation walls should be of stone, laid in mortar, and extend to or above the surface. A tight floor of boards, raised a little from the ground, to make a dead-air space, is cleaner, warmer, and better than the bare earth, and permits more fowls to be kept in the same space. I. K. F.

The Best Cement.—"S. W. C.," Deer Isle, Me. "Portland cement" is the strongest, but the dearest. "American Rosendale Cement" is as good for all ordinary purposes, but it requires more time to set. Any cement will crack if frozen when saturated with water.

Salt on Wheat.—A New Jersey farmer writes, that he has applied salt to his wheat fields; and the result was a healthier growth, an increase in yield, and comparative freedom from insects. He writes of another

who thinks that he cleared a prospective corn-field of wire-worms, by sowing eight bushels of salt per acre, the fall previous to planting. Whether salt can be applied to the soil in sufficient quantity to destroy insects and not be in too great excess for the healthy growth of the crop is still an undecided point, upon which careful experiments are needed. Whatever may have been its effect upon the wire-worms, it was no doubt useful, not indeed as directly nourishing the plants, but in acting as a solvent of plant-food in the ground, which was not before in a form available by the roots of the plants.

Saving Seed Corn.—"W. A. D.," Fillmore Co., Minn. To save seed-corn successfully in a cold climate, you should not keep it in a warm place, or especially where it is warm but a part of the time, as there is danger that the changes of temperature may destroy the germinative power. Continued warmth is also conducive to decomposition, which will destroy the life of the seed. Corn and similar seeds are best kept in a dry, cool room, where the temperature is uniform. When your seed from the "small pile kept over the living-room" failed to germinate, the cause was probably due to both dampness and warmth, which incited incipient decay. Seeds differ greatly in the degree of cold they will endure without losing vitality. Corn has germinated after having been subjected to the most intense cold of the polar regions, and an experiment is reported in which other seeds germinated after having been frozen into a cake of ice.

Trapping the Mosquito.—A correspondent near Boston sends the following morning treatment of the mosquito, which is new to us; it has the advantage over the usual slaughter with a damp towel, as it does not stain the ceiling, and the disadvantage that it does not take the insect fasting: "My wife has got—out of her own head—a little dodge which I think worth knowing. We can't abide mosquito-nets over the bed. We do the best we can with netting in the windows, supposed to keep out the mosquitoes and let in the air. But the plagues do get in, and of a morning sometimes my wife is a sight to behold. At daylight they settle on the ceiling overhead, digest their supper, and meditate on the 'good time coming' at the next nightfall. Now comes my wife's turn. She keeps a tumbler with about a half inch of benzine in it; this she seizes, and mounting on a high chair, or some steps, quickly and quietly brings up the mouth of the tumbler against the ceiling over the mosquito, which is *chloroformed* with the vapor in three seconds, and falls into the fluid below."....One of the printers in trying this, arranged a twisted wire to support the tumbler at the end of a broom handle, which much facilitates the operation.

Home-bred vs. Imported Stock.—A long time subscriber to the *American Agriculturist*, who is now engaged in the cattle business in both Iowa and Nebraska, writes as follows: "It is the opinion of many persons, that animals imported from Europe are far superior to our own. Speculators, taking advantage of this idea, are importing draft horses of an inferior grade. Yet at the same time many are fine animals of superior quality. The same is true of imported Jersey and Dutch (or Holstein) cows. The true test of the relative value of imported and home-bred cows is a careful comparison of the milk and butter records of both; this will give results to which the mere facts of importation and pedigree will be but secondary. If this test were made, thousands of dollars now sent abroad for imported stock could be employed and circulated at home to the advantage of all concerned."

Improved Plymouth Rock.—"W. H.," Saratoga Co., N. Y. The Improved Plymouth Rock fowls originated with F. H. Corbin, of Newington, Ct. This strain reproduces itself true to feather and form. The form is peculiar, being plump in the breast and square as to body, and is very much better than the original American Dominique, which was a smaller bird. The Improved Plymouth Rock is one of the best breeds for eggs and the table, as it combines the fleshy body of the Asiatic fowls, with the productiveness in eggs of the Leghorns. The hen is a good mother, and, what is unusual, the cock is a remarkably good foster parent to the young chicks.

A New Early Tomato, "The Alpha."—A basket of fruit of this variety was sent us on Aug. 23d, by Mr. Frank Ford, of Ravenna, O., as the result of his experiments during several years in procuring a variety that combined excellence of form, color and quality, with earliness. Mr. F. states that the specimens sent were gathered 94 days after the seeds were sown in the hot-bed. For the rest, we can say that in form, color, solidity, evenness of ripening, and good flavor, they are as good as the best. Owing to our absence, the basket sent on the 23d was not opened until the 30th, and there was but one tomato in the lot that was not in perfect condition, which speaks well for the marketing qualities of the variety, the future of which we shall watch with interest.

Charcoal Dust.—"F. M.," Fairfax Co., Va. This is quite insoluble, and is valueless as a fertilizer. It may be utilized as a deodorizer in stables and closets; it will make a soil warm when spread upon the surface, by absorption of the sun's rays. In a German experiment, charcoal dust was spread upon the surface of a potato field, and resulted in a superior quality of potatoes; they contained more starch, which produces the "mealy" quality so desirable for the table to lovers of the tuber.

Benzine—Moths—Fire—CAUTION.—Mr. "W. H. S.," writing from Chicago, Oct. 5, referring to our Benzine-Moth Article, last month, says "they tried it Oct. 1, at No 1279 Indiana Ave., and found its value by collecting from the Insurance Companies \$895, on damage to house, and \$1,800 on the furniture of one floor. A little fire was burning in an adjoining room; the connecting door was accidentally opened; the vapor passed through to the fire, was ignited, a servant burned, and that floor of the house and its contents destroyed."—Our "CAUTION" with the October Article was not broad enough to cover a case like this. So, while believing in the value of benzine, as recommended, we add this CAUTION:—*Never use Benzine, Naptha, or Ether, where there is a fire or light, or a match that can be trod on; nor where its vapor can escape into any other room where there is any possibility of any fire or light—whether through a door, stove-pipe, or chimney hole, or any other opening—even a crack.* Such an occurrence as that above named might not happen once in a thousand or ten thousand times, but it is best to be safe. Except when needed in carpets, it will be better to apply it to furniture out of doors, or in an out-house.—This substance is used for various purposes in the arts, and the above caution is always needed.

Amount of feed for 200 Sheep.—"H. E. W.," Westfield, Mass. A sheep of 100 lbs. live weight will require during the winter 3 pounds of hay and $\frac{1}{2}$ a pound of grain per day, or an equivalent of other food; and to each 100 head there may be given in addition, daily, four bushels of chopped turnips. At least 20 square feet of yard room should be allowed each sheep, and from 10 to 15 square feet in the sheds, which are preferable to barns.

Foul Water for Sheep.—"J. W. D.," Limestone, Texas. Water that is fouled by the washings of a sheep yard is very unwholesome for the animals themselves to drink, and would certainly produce disease. Some arrangement to avoid it should always be made.

Fertilizers in North Carolina.—In the Sept. *Am. Agriculturist* it was stated that "about \$1,000,000 were expended in North Carolina yearly for fertilizers. We are now informed that the amount "averages three million dollars per annum." In the single month of April, 1877, there were 14,891 tons sold, at an average of \$50 per ton, amounting to \$744,550. This high price is due to the credit system, or "cotton option," which compels the dealers to wait until after the cotton harvest for their pay. In North Carolina the farmer is doubly protected from fraudulent fertilizer dealers. As soon as an "irregularity" is discovered, the State sues the dealer for damages, and seizes all the fertilizer of the same brand found on sale in the State. "Not only are fertilizers analyzed, but every farmer can have the chemicals he uses in composting home manures, analyzed free of charge; and the result, together with the name of the manufacturer, is published in the local State papers."

Winter Oats in East Tennessee.—"E. H.," of Greenville, Tenn., writes that winter oats are a successful crop, being surer than wheat, and may take its place to some extent, as its cultivation is rapidly increasing. "It has many features to recommend it for general cultivation in the South, and as far north as southern portions of Indiana, Ohio, and New Jersey, and its superiority over spring-sown oats is becoming so well known among Southern farmers that the latter crop is being abandoned. The oats sown in the fall have so much longer time to grow, that they are much heavier, and yield more than double the crop sown in spring, while they ripen ten to fifteen days earlier. Winter oats make the best of fall and winter pasture, and have no rust or disease. So soon as our millers understand how to grind and prepare it, there will be a large demand for this grain, to make oat-meal, which is still largely imported from Europe, though much is now made in the Northern States." We learn, also, that this crop has been raised successfully at Framingham, Mass., and elsewhere North.

Drained Marshes.—"Amateur," Bridgeport, Ct. Salt marshes, after the tide water has been shut out by diking, are soonest fitted for cultivation by thorough draining with open ditches—tiles are likely to get clogged—and repeated plowing. Rye, oats, and grass can first be grown, then corn and other crops. The first point is to free the soil from salt, and allow thorough ac-

tion of the air in decomposing and changing injurious compounds to neutral or useful combinations. Two to five years are required to bring these drained marshes into a good agricultural condition.

A Feed Holder, or rather, a rack for keeping hay in a horse's manger, may be constructed as shown in the annexed engraving. It consists of pieces of $\frac{1}{4}$ -inch, round iron welded together to make the framework. It is hinged to the wall with staples and rings, high enough to permit of the customary quantity of fodder to be placed in the manger under the frame. The weight of the iron

keeps the hay from being pulled out and wasted, while the horse can readily feed between the rods, which are placed about six inches apart. Any blacksmith can make the rack at the cost of a few hours' time and the iron.

Bloat in Cattle.—A French Veterinarian has been investigating the nature of the gases found in the stomachs of cows and other ruminants that had become bloated from over-feeding on green clover and similar foods. Gas present in the rumen (or "paunch") of a cow that died scarcely two hours after access to a clover field, was found to consist of 74.30 per cent carbonic acid, 23.46 per cent carburetted hydrogen, and 2.21 per cent nitrogen. Neither oxygen nor sulphuretted hydrogen could be traced. In the case of a "bloated" sheep, also, 76 per cent of carbonic acid was found. From these observations, M. Reiset is led to suggest alkalies as remedies, especially recommending ordinary magnesia.

Basket Items continued on page 433.

Sundry Humbugs.

While our humbug correspondence brings us much that is amusing, it has, as we had occasion to say some months ago, its serious aspect, and many things come to our notice not calculated to give one a high respect for human nature. A surgeon in large practice once said to us: "It sometimes seems to me that every other man and woman has some physical defect," and one to inspect our pile of humbug letters might receive the impression that moral infirmities and deformities were quite as prevalent as those of a physical character seemed to be to our surgical friend. But when we look upon our budget as a focus where are centered the scattered rays of wickedness from the whole country, the case does not after all seem so bad for poor humanity. In a former volume we classified the various kinds of quack doctors, one genus being those who were UP TO THE "RELIGIOUS DODGE,"

and included those who pretended to be "returned missionaries," who picked up their cure-all among the cannibals, or some "minister of the gospel" whose "sands of life" were ever so many years in "running out," and for aught we know may be running yet. This stealing "the livery of the court of Heaven, to serve the devil in," is one of the meanest forms of rascality, and one which has found a bright, particular example in the person of

ONE MARY E. FOSTER,

which she is of Smithville, Tenn. Mary writes letters,

or, rather, postals, but, perhaps, has them written, as she can hardly get through with them all herself. The Methodist denomination being a very large and influential one, she now sends her favors to editors and clergymen of that. Mary sent us a postal. She sent others postals; indeed, she is so multitudinous in her correspondence, that she must be an important customer to the P. O. Department for postal cards—for Mary has "a frugal mind," and does not invest a 3-cent stamp plus stationery when a one-cent card will do. We received Mary's postal—it was just too gushing, so we said "bosh," and threw it among the humbugs. Mary writes to "editors, to ministers," to "Yellow Fever Relief Associations," and others, varying her introduction a little, but the rest of the precious document is essentially the same. We have one of hers addressed "to Any Minister of the Methodist Church in Flushing," and we suppose similar letters have gone to hundreds if not thousands of other towns. Here is a specimen of

MARY E.'S EPISTLES.

SMITHVILLE, Tenn., Oct. 3, 1878.—*Dear Friends:* Please see my letter on fifteenth page of the "Methodist," issued 7th ult. in your city. The great plague so drains the hand of charity in every direction and is so appalling that we are eclipsed; yet, terrific as the great scourge is, nothing, it seems to me, can be worse than to see a family die of starvation. For three days we have been without food save a little boiled pumpkin, and that is nearly gone. My husband is wholly disabled by paralysis, and he, myself, and little children must perish very speedily without relief, and it is not to be had here. My letter published in the paper was supported by the best of evidence, on which you will see the editor commends it to the charitable. The evidence, in addition to endorsement of statement and character, showed me to be more than twenty years a member of the Methodist Episcopal Church. Now my dear friends and brethren in Christ, will you please hear the cries of my dear little famishing children, together with the heart pleadings of an agonizing father and mother, whose sick of most unspeakable distress cannot much longer bear the scene. Oh! Jesus, my Saviour, help us! How can I bear it longer? Shall this return to me void? I will trust in God, through you, to send food, as upon the raven's wing. Heaven help you to make all due allowance for the importunity of a mother's bleeding heart. Yours in Christ, MARY E. FOSTER.

Letters to ministers conclude by requesting: "Please present my case at your next meeting, and ask help ere it is too late." It seems that

SEVERAL PAPERS WERE CAUGHT

by this appeal; among them our friends of the "Methodist," who gave it the benefit of their wide circulation. The "Methodist," however, has made amends by publishing the real state of Molly Foster's affairs. The Postmaster of Smithville writes that Moll is "the wife of B. T. R. Foster, one of the worst of men, who makes a living by begging and lying. He is now (11 A. M.) on the streets, in the hands of the police, raving drunk,"—and more of the same sort, and the account winds up by saying that "they are living well on the gullibility of the Northern people, etc." The Postmaster seems to have overlooked the fact that he had the power to prevent the Fosters from using the mails. He should have at once stopped their postal cards and reported the case to headquarters. Foster-he-and-she have tried the same dodge on other denominations, never having been members of any, and they are reported to be "in constant receipt of clothing and money," and have several thousands "to good." The fact that this male and female scoundrel thrive by their hypocrisy is not the worse feature of the case. It has the effect of inducing those who have been deceived by them to turn a deaf ear to the deserving.

"LIGHT TO THE WORLD"

is a favorite heading for circulars setting forth the claims of various cheap burning fluids. The sentence should be completed by adding—"bnt death to the inhabitants thereof." There are many of these murderous liquids offered, especially in rural districts, under various names. The chief claim made for them is their great cheapness, and their safety if burned in some particular lamp, or with somebody's patent "safety burner." We would most seriously entreat our readers to let everything of this kind alone—"seriously," because it is a matter of life and death—especially death. These things are called somebody's fluids.—Let all "fluids" alone—eat nothing, drink nothing, take as medicine nothing, put upon your land nothing, give your animals nothing, and especially burn nothing, that is secret. We advise the use of Paris green as an insect poison, because its safety consists in the fact that its real composition and deadly qualities are known. An intelligent person can safely handle Paris green or gunpowder, because he knows the danger. If Paris green were sold as "Pest Poison," and gunpowder as "explosive granules," they would be a hundredfold more dangerous than they now are. Burn nothing that requires a peculiar "safety" burner.

KEROSENE OF THE LEGAL STANDARD

is safe—all other burning "fluids" or "liquids," or what not, are unsafe. The difference in price is many thousand times less than nothing as compared with the risks. Use as many "safety burners" or "non-explosive" lamps as you please, but always use safe and non-explosive

oil. . It sometimes seems strange how frauds "as old as the hills" to us, strike those to whom they are new. Ten or fifteen years ago the schemes for disposing of

"THE QUEER" OR COUNTERFEIT MONEY,

were "as plenty as blackberries;" indeed our humbug articles of those days were largely occupied by them. We have so often shown up the fraud that it seems like galvanizing a corpse to allude to it at this day after so long ago having explained the whole matter in the fullest detail. In brief, there is no law to prevent one from offering to supply counterfeit money. These shrewd chaps know that only those willing to be rascals will treat with them. They are too wide-awake to have any counterfeit money at all—not a dollar. Their whole object is to get hold of the good money of foolish knaves by promises, and give nothing in return, knowing that their victims dare not "squel," as they will expose their own rascality. The style of correspondence in this line has changed, and as the present form is so unlike the old style, we give here

A SPECIMEN LETTER.

My dear Sir, I wish to secure the services of a reliable person in your county to push the sale of a certain class of goods which I manufacture. I guarantee 100 per cent profit and over according to the amount of capital invested. The goods are used by every one and the business is strictly confidential as it is the same as all other large-paying enterprises it is not exactly legitimate, possibly you can guess its nature? Should you be willing to engage let me know as soon as possible and I will send you full particulars. I am yours in confidence

NEW YORK CITY N. Y. J. B. W. Bowery
This business is only for those open for most anything there is money in.

It is an old story revamped. We have often exposed it, and could not but be amused at the honest indignation of a gentleman in Delaware at receiving a proposal like the above, and at the earnestness with which he proposed to us to have the Mayor set a "detective" on the track. . . . This mention of detective reminds us of

THE "SECRET SERVICE" HUMBUG.

We have already warned our readers against having anything to do with the so-called "Secret Service" concerns wherever they may hail from. We are reminded to repeat this warning by the receipt of a letter, which says: "it has been reported to us" that we have mentioned this company as "illegitimate," and done and left undone various matters. As we find next to no signature to the letter, merely "Sec'y," we hardly take it as proof of the "legitimacy" of anything. We do not care whether any particular "Secret Service Company" is better or worse than any other, we shall warn our readers against having anything to do with any one of them. In the present condition of society, "detectives" are sometimes necessary evils, as are scavengers and hang-men, but we do not mean, if we can help it, that the ranks of executioners, or the scavengers of material filth, or the scavengers of social filth—the detectives—shall be recruited from among farmers' sons. There are enough persons mentally and morally so constituted as to fit them to be detectives; such will naturally find their occupation. We do not approve of the scheme, and shall try in all proper ways to prevent our readers from being tempted by the promise of gain, from becoming living lies. A detective is only successful as he appears to be that which he is not. He gains the friendship of a man—rogue it may be, but still a man—only to betray him. Whether it is morally right for the law to employ such agents, we will not discuss, but we are quite sure that they should be employed only by the law, and that no "Company" has any business with them. If this "Sec'y" can, for money, buy the services of persons mean enough to go into the spy business—so utterly lost to all proper feeling as to engage in the business of man-trapping—we shall endeavor that his detectives shall not come from the readers of the *American Agriculturist*. It only needs that the mean, sneaking character of your dirty business shall be known, for every honest young farmer to reject your offers—imperative subscription to your paper (price \$2) included.—By the way, Mr. "Sec'y," what a high old detective shop you must keep!—The only way your crew of spies and sneaks can succeed is through secrecy—yet you go and publish in your paper their portraits with their names! We only wish we had space to reproduce your "portraits."—No one would ever join such a bad looking crew! Did you not make a mistake and reproduce these pictures from the "Rognes' Gallery?"—Wood engraving can not have reached a high development in your town, or you must have some remarkable people in your employ (paper \$2 per annum). One man has one of his eyes staring like a peeled onion, while the other looks like a cranberry. What nonsense it all is, is shown up in capital style by the "Buffalo Express," for they have or had—it is now shut up—a "Secret Service" shop in Buffalo also. The article is appropriately headed.

"HUNDREDS OF FOOLS,"

and gives the whole thing a first rate exposure. The "Express" is rather severe though on the foolish chaps who have applied for employment on this "Secret Ser-

vice," in giving their letters with names and dates. One poor fellow refers to his neighbors, "they never noing me to reviel a secret yet to enny pursson;" another says: "I think i would Bee qualified to fill the place, i never was noan to tell a secret in mi life." This "INTERNATIONAL SECRET SERVICE COMPANY" consisted of just one man—one Hopkins—and when Hopkins was arrested and put in jail as a fraud, they had the whole "Company."—"International" Hopkins was unlike some other companies, as he asked \$3 for his paper. He had at the bottom of his letter sheets "All Communications Strictly Confidential"—which is a good thing to have—ain't it now, Mr. Sec'y?

MEDICAL HUMBUGS.

seem, as the market reports say, to have an "upward tendency," and we have several very interesting ones, but as our space is limited, we take the briefest pamphlet, that of one "Magnetic cure," a name not indicating originality, by one Heath. It is of only 16 pages, each of the size of a small letter envelope, 8 pages being devoted to the business of getting agents, and the others to "A Chapter of My Own Life," etc. We have seen a great many quack medicine stories, but never one quite so stupid as this—Heath is evidently a green hand. He "was born with a good constitntion," but as he fails to tell the street and number, we may doubt whether he was born at all? Heath grew up, became a doctor, had fever and ague, had it bad, and "at last guided as I firmly believe, by the hand of Providence, I

OBTAINED A COMBINATION,

which, when tested on my own person, at once brought relief." Was there ever anything more prosaic? No Indian squaw, no picking up the recipe on the sea shore enclosed in a bottle, no old woman, no nothing. "The effect is like Magnetism" his wife remarked one day, and it was called the "Magnetic cure." And "Agents are wanted in every town in the U. S." It is a very dull pamphlet, but its peculiarity consists in its pictures. We have as a frontispiece a female standing on nothing in particular, scattering flowers. Then we have a cut of the plant that furnishes black pepper, for the sake of variety probably, placed sideways instead of upright, then lastly we have a very dark view of a landscape labeled, "Where the Cerasin grows." The funny thing about it all is, that there is no reference to the pictures in the pamphlet. As "Cerasin" is the name of "Cherry-tree gum," we cannot see why we should have a picture of the place where it grows in a fever and ague pamphlet, which we only notice as being quite the most stupid of anything in this line of literature, that has fallen under our notice—and that is saying a good deal.

The New York Horticultural Society held its Autumn Exhibition, beginning Wednesday, Sept. 25th, and continuing for the rest of the week. As a whole, the show was the best the Society has yet held, and while choice plants were its strong feature, the fruit was more abundant and finer than on any former occasion. The only draw-back was in the borrows called floral designs, some of which were so distressing as to be "Horticultural Absurdities," and are referred to in an article elsewhere with that title. We have seen no report of the prizes; the competition in some classes was very close, and it would be interesting to know the awards. The collections that most interested us, were those of wild flowers, made by the sons of Doct. F. M. Hexamer, of New Castle, Westchester Co., N. Y., who appear to inherit the tastes of their father. This Society has yet to learn the value of printer's ink. Its exhibitions are not properly announced, and are not sufficiently advertised; the daily papers give them but little attention, and after the prizes are awarded, no report of them appears—so far as we are aware. It should be recollected, that those who send fruits, flowers, etc., from a distance, do it in part for the publicity it gives their establishments. As now managed, it is too much like a close corporation.

Horse-Shoe Nails.

One of the most prominent of all causes of lameness in horses is the slivering of poorly made nails, a portion of which pierces the sensitive part of the foot. Figure 1 illustrates how this may occur, even without the knowledge of the shoer, as part of the nail follows its proper course, and is clinched on the outside of the hoof, as if it were the whole nail. Even if the splinter has so pricked the horse, as to convince the shoer of the fact, and he attempts to draw the nail, it will often break off and leave a piece in the foot, to remain a festering cause of lameness, it may be for life. In figure 2 is represented a nail which has splintered in the foot, and broken when being drawn out. It is said that this nail was made from cold rolled iron, and slivered when being driven by a shoer in Providence, R. I. C represents the part which was clinched on the outer surface of the hoof; A that which was driven through the soft lamina lining the hoof, and into the coffin bone, where it was broken off.

Lockjaw followed, and resulted in the loss of a \$1,000 horse. There was less difficulty of this kind in the days when blacksmiths made their own nails from the best Norway iron; but of late years, since machine-made nails, costing but a fractional part as much, have come into use, lameness from this cause has been frequent and

Fig. 1.—SPLINTER PIERCING THE COFFIN BONE.

expensive. To make a horse-shoe nail by machinery, which would be equal in texture to the hand-made nails, and could be sold at a low price, has been the effort of the Putnam Nail Company of Boston, Mass. After years of experimenting, they perfected machinery which, essentially, is a series of small hammers that, in operation, pound upon a rod of hot iron, turning out a finished, pointed nail, in every respect equal to any made by hand. It is well known that iron shaped by machinery, when cold, readily splinters, as may be shown by twisting a piece of wire; and it is now claimed, because ordinary

Fig. 2.—KILLED A \$1,000 HORSE.

machine-made horse-shoe nails are cut and pressed out of cold iron, that they splinter from that cause; while those hammered out of iron at a welding heat, do not so splinter, and hence are superior to any others. The "Putnam hot-forged and hammer-pointed horse-shoe nails" are recommended by many of the most prominent horsemen and farriers in the country, who corroborate the statement of the manufacturers that these nails do not sliver in driving, and that they combine strength, toughness, firmness, and freedom from flaws to a remarkable degree.

Some Rifle Shooting Notes.

A large number of queries about guns, rifle shooting, etc., have accumulated on our table. The following will answer two score or more of them:—[I.] The new long-range bullet weighs 550 grains, the same as its predecessors, and only differs in length and point. Fig. 1 is the

Fig. 1.

Fig. 2.

exact size and form of the older one (diameter $\frac{4}{100}$ ths of an inch, and length $1\frac{1}{4}$ -inch). Fig. 2 is the new one (diameter $\frac{4}{100}$ ths; length $1\frac{1}{16}$ -inch). The latter cleaves the

air more readily, requires 3 or 4 minutes of a degree less elevation for 1,000 yards, and is a little less swayed by the wind on account of its greater velocity. The pointed bullet would have greater penetrating power, but less "smashing" effect in striking an animal than the blunted point...[II.] Experts are using harder bullets than formerly. 1 part tin to 15 of lead was generally adopted, but most now use 1 to 11... [III.] The "best shots" are those who regularly keep up a high score. Extraordinary scores may occur in anyone's experience. Within two months after making the first shot at 1,000 yards, the writer put 18 out of 20 successive shots into the bull's-eye and the two other close to it, and this in a wind which required aiming $7\frac{1}{2}$ feet to the left, a steady wind, however; but we would not like to guarantee being able to repeat that score once in every ten or twenty trials. Mr. Selph, of New Orleans, acquired much reputation for a great score or two, but the writer easily excelled his score when shooting with him on the same target. Prof. Dwight made a noted score at Pittsburg, but fell much behind at Creedmoor. Mr. Partello, of Washington, has made the highest score yet, viz., 44 bull's-eyes out of 45 shots, at 800, 900, and 1,000 yards. He will be cheerfully awarded the championship by all riflemen when he repeats the score, or makes three or four more scores anywhere

near his now famous one....[IV.] A general rule for long-range shooting is that the bullet weigh about 5 times as much as the powder; or 105 grains of powder to a 550-grain bullet. The writer, after several trials, adopted 97 grains, and has not found reason to change. Our 2½-inch shells will not hold more in ordinary loading, though 100 to 105 grains have been put in by dropping the powder into them through a 3-foot glass tube....[V.] Five to ten per cent more of powder will pack into a shell by pouring it slowly directly into the neck of a funnel from a height of a foot or more, or through a long smooth tube....[VI.] The weapon used by Mr. Partello was the "Remington Creedmoor," the same one offered as premium 92, page 447, of this paper....[VII.] Cyanide of Potassium is the best cleaner for used shells. Remove the exploded caps or primers; wash them out in two or three waters; immerse them three to five minutes in a solution of a lump of cyanide the size of a small egg in 2 or 3 quarts of water; pour off the cyanide, and wash with plenty of water; then dry them thoroughly, standing upright, on a dish in a warm, but not very hot oven, or other place. The cyanide solution can be kept covered for future use, adding a little lump more, as needed. Note that it is very poisonous; keep it safe from children, or others; also from spattering eyes, face or hands...

Fig. 3.

[VIII.] The velocity of a 550-grain bullet with 100 grains of powder, going 1,000 yards, starts at about 1,400 feet per second, and ends at 1,000 yards at about 650 feet per second, having a velocity of nearly 900 feet per second at 500 yards or midway. The resistance of the air constantly retards it. The total time is a little under 3 seconds for 1,000 yards, or 3,000 feet....[IX.] A bullet would fall about 16 feet the first second, 48 feet the second second; 80 feet the third second; or 144 feet in 3 seconds. To overcome this falling, the rifle is aimed much above the target—from 125 to 160 feet above it for 1,000 yards, depending upon the powder, a front or rear wind, condition of the atmosphere, etc., but the sights are arranged to aim directly at the target as shown in fig. 3....[X.] The path of the bullet is so high, that if a man were on the top of a high

dition. Thousands of calves in the dairy districts are now "deaconed," or slaughtered for their hides, the hides selling at from 40 to 50 cents, and the runt from 8 to 16 cents. Many of these calves are surreptitiously sold in cities for veal, bringing but a small price. This gentleman finds that calves can be transported to Kansas, Nebraska, and Dakota by his method at a cost not exceeding 15 cents a head per day for food, during the journey, while the carriage from Chicago is not more than \$1 each. Once across the Missouri River, where food is plenty, there is a great demand for them, when they can be bought at moderate rates. This method of supplying the far West with young cattle promises, if successful, to become quite an extensive business.

Cheaper Shorthorns.

While the farmers of Kansas and Nebraska are bringing in from the older States many Herefords, Devons, Ayrshires, etc., they have a decided preference for Shorthorns. Many of these are obtained directly from the Blue Grass regions of Kentucky; others are purchased from Iowa and Illinois; and still others come from New York and other Eastern States. During the past two years the prices of fancy pedigrees have materially diminished. Short-horn bulls which ranged from \$200 to \$400 in 1875-6, are now frequently to be had at from \$75 to \$100.

Agricultural Machinery on Western Farms.

The prairie farmer is strongly tempted to invest in much machinery. On account of the scarcity of labor, and the great amount of work that can be done by mowers, reapers, and other machines, he is very apt to run in debt, or to mortgage his land for means to buy them, and at once gets "his nose on the grindstone," where it is often held for many years. All over the Prairie States one encounters pre-emptionists and land purchasers who are worrying under the debts they have contracted for machinery. The wonderful saving of labor by their use makes it desirable for the settler to secure as many as possible of those machines, provided they are good. Yet farmers with small means should be careful how they contract for them, without seeing their way clearly to payment. The crops relied upon to furnish the means of payment may fail, and then comes embarrassment. One point we would especially enforce, *i. e.*, the exercise of the greatest care in the selection of all farm implements and machines. In our intercourse with the far Western farmers during our visit among them last year and the present season, we were surprised to observe how utterly worthless is much of this machinery. It easily gets out of order, and is liable to require frequent tinkering and repairs, and thus becomes a constant source of annoyance to the owner. Agents for farm machinery of all kinds are to be found offering their wares to farmers at every turn, and, owing to the competition, making "special inducements to purchasers." The farmer who has had little or no experience, is quite too apt to "buy in haste, and repent at leisure." Every stranger must be struck by the careless manner in which costly machinery is left out of doors exposed to all changes of weather. Some make the plausible excuse that they have no farm buildings as yet, but it is a very easy matter to extemporize some kind of shelter, even if it consisted of nothing more than wild hay, corn stalks, or a straw shed. Many thousands of dollars are annually lost by prairie farmers through neglect to properly care for implements.

A Blessing in Disguise.

Strange as it may seem, it is the general opinion in far Western States, which a few years ago suffered so severely from grasshoppers, or locusts, that this visitation resulted in more good than harm, and that they were actually "blessings in disguise." Some prominent men of Nebraska argue thus: The State was rapidly filling up with an indifferent class of people from the older States. Thousands who had failed in other localities, were coming to Nebraska with the expectation of getting a living without working for it, and as many others were coming without the necessary means to start in such a manner as would lead to success in the future. The new State promised to be overrun with a population that would prove an incubus,

rather than a benefit. The grasshoppers came, and they weeded out this indifferent and unwelcome material, and left the land to be possessed by more worthy successors. After two or more years' struggle with the grasshoppers, the faint-hearted gave out, abandoning their improvements and returning as they best could, to their former homes and friends. As a result, the farmers who remain represent the pluck and courage of the country. It has been a case of "the survival of the fittest," and the present population is a splendid foundation upon which to rest the future success of the State. One of the most prominent men in Nebraska, said to us: "I have no doubt that the grasshopper was the salvation of our State, and has prevented us from being at this time in the midst of general distress and trouble, notwithstanding the abundance of our crops." The manner in which worthless elements were packed into this State in 1873, threatened not only to give an unfavorable mould and character to the population, but to ruin the State itself. The grasshoppers, however, the ravages of which were in many cases greatly exaggerated, turned back the tide, and drove away the undesirable classes who had already effected a lodgement here. Now, the destitute are few in Nebraska, and every one who will work, can earn a living.

Fears of the Indians.

All through the Western States, there has been, during October, an unsettled feeling, due to the forays of the Indians from their reservations. As is always the case at such times, the dangers are exaggerated, and farmers and stock-breeders are driving their cattle from long distances to points of safety, where they cannot be stampeded by the redskins. The number of U. S. troops is far too limited to afford protection to the frontier farmers or ranchmen. In the elections this fall, these border State men promise to make the reduction of the army a main issue, and assert that they will, without regard to past or present political proclivities or parties, vote together against those who do not publicly avow themselves in favor of properly increasing the forces of the regular army.

took the Advice—"Go West Young Man."

Last Winter, an old subscriber of the *American Agriculturist*, who had been unfortunate, and was very much reduced in circumstances, called at 245 Broadway, New York, for counsel and advice. He had a large family of children, and was very despondent about the future. We recommended him to obtain sufficient funds from his friends, to enable him to move to the West, and locate on a prairie farm. This advice was followed. He left Pennsylvania for Nebraska, on the 26th of February last, and on the 16th of March, he was fairly settled with his family on a partially improved farm of 480 acres, in Lancaster Co., Neb., which farm he had agreed to work upon shares. We have just called on him (October) in his Nebraska home, to ascertain what success had attended his removal hither, and this is his report: "On reaching Lincoln, I paid \$300 for a wagon and a strong team of horses—having brought the harness from the East. I also purchased a plow, which completed my outfit, the place having sufficient other implements, such as they were, also cattle and other stock." With his four sturdy boys he planted 100 acres of corn and 50 acres of spring wheat and other crops. The butter which he made and sold during the season, nearly, if not quite, paid his family expenses. Now, at the end of six months, he estimates the results of his half year's work as follows: The figures represent his share of the crops, and the prices are, as will be seen, moderately estimated:

2000 bushels of Corn, at 15 cents..... \$300.00
300 bushels of Wheat at 65 cents, deducting
\$56.10 for 66 bush. of seed wheat paid for at
the contracted price of 85c. per bushel..... 138.90
200 bushels of Oats at 25c..... 50.00
200 bushels Barley at 25c..... 50.00
250 bushels Potatoes at 20c..... 50.00
10 tons of Hay at \$2.50..... 25.00
25 Pigs at \$2.50..... 62.50
9 Ducks at 44c..... 3.96
Garden Truck..... 3.00
Total..... \$683.36

Considering that he has had a living for his family during these six months, the old subscriber from Pennsylvania feels well satisfied with the

above figures. He asserts that to secure an early competence for himself, he only requires sufficient money to purchase cattle. His corn and other grain would pay him far better to feed than to sell it at present prices, while the prairies afford any amount of pasturage and wild hay for cattle.

Shepherd Dogs.

Some dog fancier or breeder could make a handsome sum by giving his attention to the raising and training of shepherd dogs. There is a large demand for well-trained dogs all throughout the sheep-growing regions of the West, and as the flocks of sheep multiply, this demand must increase.

Prairie Chickens.

Prairie chickens are abundant in Western Iowa, and in the country beyond the Missouri, this fall. Two years ago, the Legislature of Nebraska, enacted a law, forbidding shooting these and other birds. The measure was so sweeping in its provisions as to encounter powerful opposition from sportsmen, and also from those farmers who desired the change in their diet which these birds insured. The bill was ultimately pronounced unconstitutional by the courts; not, however, until it had been enforced long enough to insure a very great increase in the number of prairie chickens and other birds, and the immunity which they enjoyed from sportsmen, affords one explanation of the unusual abundance of prairie chickens in Nebraska, this season.

The Chinch Bugs

have made serious depredations in some parts of the far West, during the past year. Prof. Aughey, who has devoted much attention to the study of this pest, strongly advises farmers to burn their wheat stubble, and thus destroy the eggs which are generally laid at the roots of the plants. He assures us that, from his observations and experiments, he is confident this burning process will go far towards exterminating this dangerous foe.

The Western Locust or Grasshopper—Its Visits no Longer Feared.

BY PROF. S. AUGHEY, OF THE UNIVERSITY OF NEBRASKA.

[The following, from Prof. Aughey, the well-known Western Naturalist, will do much to dispel the apprehensions of those who hesitate to go West for fear of the invasions of the locusts. We may add that the views of Prof. A. are in accordance with those of the U. S. Entomological Commission appointed to investigate this insect.—Eds.]

It is well known in the West, that during the winter and spring of 1877, I predicted that that season would be the last of the locust visitations for many years. The U. S. Entomological Commission entertained the same opinion. On the 16th of June, 1877, Prof. C. Thomas and myself, in a report to the Governor, which was published at the time, used the following language: "*** We consider the danger from the young, which have hatched out this season in Nebraska, over, and that this part of the problem is solved. We also believe that the long series of visitations has come to a close. There may be, and doubtless will be, at irregular periods, visitations by migrating swarms, but it is not at all likely that the present generation will witness another such a series as that which has just passed." The predictions made at that time, were singularly verified for that year, and have been for this. Our conclusions were based on facts that we had learned about the natural history of the locust, which have stood, and no doubt will stand, the tests of time. There need, therefore, be no fears of another series of visitations from these insects. Even if they should come again in the distant future, they can not hereafter do the damage that characterized their last visitations. There will be then such a large amount of produce in the State, owing to the greatly increased area cultivated, that locusts will not be able to make much, if any, impression on the crops. Besides, the people have learned how to contend against them. They know now how to meet this enemy as it appears in spring, and it has lost all its terrors to them, especially to those who were here during the spring of 1877.

Movable Feed-Door for Pig-Trough.

"E. W., "Aroostook Co., Me., sends a drawing of a trough for feeding pigs. The door, C, fig. 2, is

hung on hinges at the top, and when closed is held in position by the bolt, E, sliding down into a groove. When going to feed, the bolt is pulled up, the door is swung in beyond the trough, which is placed close against the front of the pen, as shown in the engraving, and is bolted inside of the front of the trough. This holds the door in position, and shuts the pigs away from the trough until it is cleaned out, or the swill or other food poured in, when the sliding bolt is raised, the door swings to its place by its own weight; the fastener is then slid down

Fig. 1.—FEED-TROUGH CLOSED.

Fig. 2.—MOVABLE DOOR TO PIG-TROUGH.

into the groove, and all made close. Figure 1 shows an end view of the trough and door.

Selecting Seed Corn.

Two ears or more, regularly, to a stalk, is a great desideratum in corn, and should be an essential point in selecting ears for seed. Size, however, is of secondary importance, the almost universal practice of farmers to the contrary notwithstanding. If the reader will take a long ear—almost any one—he will observe that the kernels are rather loosely set on the cob, and are roundish in form. Then take an ear of ordinary length (8 to 10 inches long, 8 or 10-rowed), well filled out at both ends, having a *small cob*, and the butt no larger than the middle, —on such an ear the kernels will be so close set as to be flattened by the pressure, and often all sides will be compressed and angular, and the texture of the grain will be more compact than on the loosely set cob. Now shell *equal lengths* of both ears, and it will be found that the small ear will yield more bulk and weight of grain than the large one, provided both have the same number of rows, and we have seen an eight-rowed ear that yielded as much as a ten-rowed one. Any one can test this.

The obvious inference from these facts is, to select for seed corn ears from stalks bearing two or more ears, having the kernels compactly set, the ends well filled—good plump kernels should cover the "nubbin" end of every seed ear,—the butt of uniform size with the rest of the ear, which should not taper much, but hold the same size from butt to tip, and a *small cob*. These essentials obtained, the larger the ear the better, of course; but the small ear possessing them, is better than a large ear without them. The shape of the kernel from such an ear (of Northern corn) will be long from the cob outward, broad crosswise of the ear, and very thin, and its texture will be hard and compact. These rules for selection of seed corn apply particularly to the varieties known as Northern or

Canada corn; but the same principles apply as well to the many rowed Dent and White varieties grown in the West and South, and they are derived from the experience of intelligent, practical farmers.

The Guenon Milk Mirror.

The "Escutcheon" or "Milk Mirror" of Guenon, long the subject of much discussion, is receiving a practical test at the hands of a Commission appointed by Gov. Hartranft, of Pennsylvania, to act under the direction of the State Board of Agriculture. The result of the first reported examination of several herds, is strong corroborative evidence of the value of the escutcheon as an indication of the milk and butter qualities of a cow. The following table shows, in condensed form, the account of the cows as given by their owners, in comparison with the estimate of the Commission, which is based chiefly on the "milk mirror," but includes also the general appearance of the animal:

Breed.	Age.	OWNER'S ACCT.			THEORETICAL INDICATIONS.			Form of Escutcheon.

* 10½ lbs. butter in one week; only trial.

† 16 lbs. 3 oz. butter in one week; largest milk record lost.

‡ 18 to 20; in such cases we give the average to save space.

The table shows a remarkable coincidence between the escutcheon indications, and the recorded facts of the cows' performances. This careful investigation promises to confirm the opinion of stock men who have given this subject careful study, if this, the first trial, is an indication of subsequent results. If we carry this so far as to be able to judge of nearly the exact quantity and quality of a cow's milk before purchasing, it will be a great advantage, and place dairying on a more certain footing as a business.*

Light Power Stone Dray.

An improvement on the ordinary stone-boat, is represented in the engraving, made from a sketch taken at "Deerfoot Farm," Southboro, Mass. The "body," 8 ft. by 34 ft., is made of strong planks, with heavy side pieces, similar to an ordinary stone-boat. The rear wheels, 18 inches in diame-

STONE DRAY.

ter, are two thicknesses of plank, with iron boxes or hubs, and tires five inches wide, and run on a heavy axle taken from a broken down cart. To the under side of this axle the body is strongly bolted. For front wheels, any heavy cart wheels are used. The body is suspended under the axle by a bolt, ring, and hook, as shown in the engraving. Such a dray permits a greater weight to be drawn at one time, and with a much less expenditure of team force, than any stone-boat without wheels. With it, stone or other heavy articles

*This theory is fully explained, with illustrations, in "Guenon on the Milk Cow," Orange Judd Co.; price 75c.

can easily be drawn long distances, and it hangs so low that there is little difficulty in loading it, while the broad tired wheels enable it to be used on soft ground. This dray has played an important part in the clearing of stony land, and in other improvements of "Deerfoot Farm," and the simple attachment of the low wheels has saved to the owner many times the amount of their extra cost.

Relations of Fertility to Stock Breeding.

Barnyard manure is but the hay, grain, and roots, fed to animals, deprived of that portion of their substance used to make flesh and bone, milk and wool, with the wastes of the system added, and the whole mixed with refuse of the yard and stable. In practice we find that the dung of animals contributes to the growth of crops, because it is composed of the substance of those crops. And since the quality of the manure depends on the food consumed, the manure from grain fed animals is more valuable than that produced from feeding roots and hay alone, as grain (the seed of plants) contains a far larger proportion of the more important elements of fertility, than the stem or roots of any plant.

Investigations by Lawes and Gilbert upon the comparative values of manures produced from different foods, showed that, when reckoning the manure made from feeding a ton of hay at \$10.00, the manure from a ton of

Clover is worth.....\$15.00 Wheat\$11.00
Oat Straw..... 4.50 Indian Corn10.50
Wheat Straw..... 4.16 Barley..... 9.83
Barley Straw..... 3.50 Potatoes..... 2.33
D'c'd Cotton-s'd Cake43.33 Mangolds..... 1.66
Linseed Cake..... 30.65 Swedes..... 1.41
Malt..... 10.50 Turnips..... 1.39
Oats..... 11.50 Carrots..... 1.33

The most remarkable fact in this table is, that the cotton-seed is worth more for manure, after having served its end as a nutritious food, than its first cost. This is due to its unusual richness in potash, phosphoric acid, and nitrogen, which are removed by digestion in small part only, its more valuable nutritious portion, the fatty ingredients, having little commercial value as plant food. Indian corn, our most prominent grain food, also gives a high value to the resulting manure. But in selling any of these for food, we only obtain a price corresponding to the amount of digestible material that the animals abstract from them, nothing being allowed for the increased value of the manure heap which is derived from their consumption.

Now with every cargo of corn, oats, or barley, shipped abroad, we send out of the country, away from our farms, an amount of fertility equaling nearly half the entire proceeds of the grain, for which we get no return; and in oil cake, more fertility than its selling price would purchase. Where does this fertility go to?—The grain and oil cake go to Europe, to make beef and mutton for the great English and other markets, and the manure resulting from feeding it enriches foreign soil. Indeed, it is largely to the feeding of cattle and sheep for beef and mutton, that English farmers owe the great fertility of their highly productive lands.

In the light of these facts, is it not better for Southern farmers to convert their refuse cotton seed into beef and mutton, and in selling the latter get as much or more, than they now obtain for the former? while still preserving to their lands the great amount of fertility which is removed in the seed of their cotton, and which they now give away? In the present and increasing demand for American meat abroad, it is well for our farmers, East, West, and South, to consider the feeding of grain for beef and mutton, as a means of ready profit in the sale of meat, and for retaining the fertility which they are now sending over the sea in almost numberless cargoes. Farmers who can not afford to or can not conveniently raise grain for stock food, should consider that in every ton of grain purchased and fed, a large percentage of its cost is retained in the manure heap, perhaps saving the expenditure of just so much money for commercial fertilizers. With a proper selection of animals, and with proper feeding and care, the beef, mutton and pork produced, ought at least to pay the cost of food and labor, leaving the resulting manure as so much clear profit on the investment in stock, buildings, etc.

The Arcy Dairy Farm Near Paris.

[From Our Special Correspondent.]

The Department of Agriculture is very fully represented at the Paris Exposition. The exhibits of tools, machinery, fertilizers, and various farm products, occupy eight different buildings, six of them in the French section. In Pavilion No. 1, devoted to "Products of Agriculture in France," one of the most interesting exhibits is that by the Arcy Farm, L. Nicolas, proprietor. Occupying a wall space, 75 feet long and 12 feet high, are four water-color paintings, 24 x 36 inches, showing two cow-stables, that accommodate 54 and 64 head of cattle; a sheep-house divided into two sections, together accommodating 1,400 sheep; a model milk dairy; maps

chateau with parks surrounding it, vegetable garden, and out-houses, 65 acres; wood land, 202 acres; roads, lakes, ponds, sand-banks, etc., 7 acres. Most of the soil was naturally poor, and had been poorly cultivated. The surface soil, composed of silica and white clay, was almost impermeable, and the subsoil, composed mostly of clay, mixed with ferruginous sand, was intermingled with stones and rocks. In the best parts the arable surface varied in depth from 16 to 24 inches. Of the 525 acres of unproductive land, 375 had lain waste upwards of 70 years. During the past eighteen months this waste tract has been cleared and reclaimed, and ture land, 30 acres; orchard and vineyard, 1 acre; over 600 cords of stone extracted and used in constructing buildings and roads. Drainage was commenced soon after the purchase, and continued

His business in the city was conducted through numerous agencies. Why not make use of these and undertake to deliver milk in Paris—milk guaranteed to be pure, unskimmed, and fresh?—He posted himself on the prices of milk in the different sections near Paris, and thought he could see sufficient profit in the business to warrant him in entering the field and practically testing the question whether Paris needed more and better milk, and whether he could satisfactorily supply that want. He began to send milk to the city, and to make it known that he was prepared to supply customers at their homes. The Parisians bought it, and called for more. The price at first was 10 cents per litre (a little more than a quart). The demand continued to increase. He raised the price to 12 cts. per litre. As his success increased, he began to enlarge his

of the farm, and plans of the different buildings. Below on a shelf are arranged samples of the various products, etc., of the farm, including twenty bottles containing specimens of soil; twenty others of fertilizers that have been tested; varieties of stone extracted from the soil; specimens of the first crop of Lucern this year, which is three feet high, and averaged 385 bottles (tnmbles) to the acre; salt for cattle and sheep; one clipping of wool from a Dishley-Berrichon sheep, weight 9 lbs.

11 ozs.; bottles of barley, oats; and English, Bergues and Childam wheat, etc.; potatoes, beets, and turnips; cotton-seed cake used for feeding cattle; and lastly, improved cans, jars, and baskets, used in conveying milk to market.—It is easy to make fine pictures of a farm, but we felt curious to see if Mr. Nicolas' was equal to his water-colors, and on August 7th, after some preliminary correspondence, we had the pleasure of paying him a visit. The estate is in the Department Seine-and-Marne, about 35 miles southeast of Paris, on a plateau, looking down upon the picturesque valley of Yères, and the pretty village of Chaumes, to which it belongs. When purchased by Mr. Nicolas, March, 1872, the Arcy Farm was comparatively small and well nigh worn out. He has since made 64 additional purchases, gradually enlarging its limits, until it now comprises 1,205 acres.

It was originally divided as follows: Unproductive land, 525 acres; plowed land, 375 acres; pas-

uninterruptedly until June, 1876. The 760 acres drained had 145 miles of drain laid, at a total expense of \$19,693—an average of about \$25.75 per acre. The land thus redeemed was previously uncultivable, being wet and cold. One field of beets had been planted, but rotted in the ground and were not gathered. The same field is now one of the best on the farm. Seven miles of ditches were dug, at a cost of \$1,913. An extensive marl-pit on the estate, supplied 800 acres, according to need, an average of about 6 cords being put to each acre, at a total cost of \$5,989. Forest trees were planted on 58 acres found unfit for cultivation.

The large expense incurred for manures led to a new idea which, when developed, changed this place into a stock and dairy farm, and insured the success of an undertaking, which, at the start, was more or less problematical. The production of stable-manure was at first very small, and he found it necessary to purchase substitutes, including 517 tons of night soil from Paris, delivered between April 1st, 1872, and June 1st, 1873, which formed an excellent fertilizer, but the expense, upwards of \$8,000, prevented him from continuing its use. During the first year the different fertilizers used cost \$14,336, and during the five years, ending 1877, a grand total of 6,000 tons, costing about \$39,000, besides 4,522 cords of stable-manure, produced upon the farm. Naturally enough there could be no profits while this expense continued, and the wealthy merchant, who wished to see Arcy a financial success, as well as a pleasant country home, began to look about for an answer to the difficult problem: "How can I make my farm pay?"

facilities for production, and to improve his method of packing and delivering the milk.

The new farm buildings are arranged about a hollow square, as shown in the sketch (see fig. 1), and cover 60,000 square feet (about $1\frac{1}{11}$ acre), with an inner court-yard of 90,000 square feet ($2\frac{1}{15}$ acres). They are built of stone, with thatch roofs. Over 1,200 cords of stone masonry were used in the construction of these buildings; all of the stone, together with that used in paving the court-yard, was extracted from the adjoining fields. By means of reservoirs and pumps, water is conveyed to all points where required for the stables, cow-barns, sheep-pens, etc. The expense of these new buildings, and furnishing them, was \$44,900. A new stable was now added, the number of cows doubled, and a new creamery made, with fittings in white marble, and every convenience for receiving and cooling the milk and packing it speedily.

At first the milk was sent to the city in tin cans, lined with cork, and measured out to the order of the customer. But white glass jars are now used, holding one and two litres, and each sealed at the farm. Herewith are engravings showing the form of the can, with sectional cut, indicating the cork lining (see figs. 2 and 3); also of the glass jar now used (fig. 4), and of the wicker basket in which the jars are packed during transportation (fig. 6). Figure 5 shows the lead seal, stamped with the name "Domaine D'Arcy," by which the cover of each jar is held in place, and the genuineness of the milk assured. Delivery wagons of attractive pattern were built, aiding to advertise the new busi-

ness to the Parisian public. The price was again increased, this time to 14 cents per litre (the present price); but its value is now well understood, and the demand, still steadily increasing, has crowned the undertaking with success. Others have since entered the same field, and bottled milk of absolute purity is now sold in Paris in large

Fig. 6.—BASKET FOR MILK-JARS.

quantities, and an English Company is preparing to supply London with milk after the same system.

There are 117 cows in the Arcy stables, all of Normandy stock. Mr. Nicolas seeks to feed them in such a manner that the milk shall be of unsurpassed excellence, making quality rather than quantity his aim. The following table shows the kind and amount of food given to the cows during the month of April last; also an analysis of the milk, at a temperature of 40.28° Fahrenheit; and at a specific gravity of 1.33:

FOOD FOR COWS. PER HEAD.	ANALYSIS OF MILK.			
	In the Milk.		In the Ash.	
Sugar-beets.....77½	Butter.....42.2	Phos. Acid.....2.529	Albumen.....11.7	Sulphuric Acid.....1.03
Cotton Seed.....6½	Casein.....23.5	Potassa.....1.739	Sugar.....55.2	Soda......725
cake.....6½	Ash.....7.7	Lime.....1.852	Total solid matter per litre.....140.3	Magnesia......108
Lucern.....20	Water.....892.7	Silica, Oxide of Iron, etc......597	Total.....7.710	
Oat Straw.....18				
Salt.....1½ oz.				

The cows are milked in the morning between 2 and 3 o'clock; by 6 o'clock all has been bottled and boxed; at 6½ o'clock it leaves the neighboring railway station for Paris, and at 9 A. M. reaches the city. The second milking is at 3 P. M., which reaches Paris at 10 P. M., ready for early morning

Fig. 7.—THE PACKING-ROOM OF ARCY FARM MILK DAIRY.

delivery. The daily average of sales, at this mid-summer season of the year, is 840 litres (837½ quarts).

A secondary advantage of great importance has followed this new departure in the management of Arcy Farm,—the production of stable-manure has increased very largely, and at the present time very nearly equals the demand. A large manure pit, walled around with stone, will be noticed at the center of the court-yard (fig. 1), and near it is a reservoir into which the liquid manure is conducted by underground pipes. The improved cultivation of the fields has been pushed forward with unabated activity, and at the time of our visit, when the harvests were being gathered, the vast fields of wheat, oats, and lucern, presented an appearance of remarkable thrift. Mr. Nicolas now has 815 acres capable of cultivation, which are divided as follows: one-seventh devoted to beets, potatoes, buckwheat, and carrots; one-seventh, fallow ground; two-sev-

enths to wheat; two-sevenths to oats, rye, and barley; and one-seventh to lucern and clover.

As on nearly all French farms, considerable attention is paid to the cultivation of lucern, a relative of clover highly prized as feed for cattle. It bears much larger crops than clover, growing two to three feet high, and two or three crops are cut each year. The harvested wheat is stacked and not thrashed until required for use or market. The thrashing is done by steam power, which is also utilized, in connection with improved machinery, for sorting the grain into different grades, according to size and weight of the kernels, and preparing food for the pigs and sheep.—The sheep house is substantial and convenient, and contains about 1,000 head of French and English breeds.—The most improved farm tools are used, including several of American make; and in every department Mr. Nicolas has taken advantage of all the facilities which modern science offers. By these, with his native ingenuity and good sense, he has, in six years, converted a most unpromising farm into one that is a model in every respect, and that is, with fine future prospects, more than self-supporting now.

PARIS, August 18, 1878.

G. W. W. H.

Among the Farmers.—No. 34.

BY ONE OF THEM.

Influence of Early Breeding on Milk.

Well fed heifers, not too fat, incline to breed at about 7 to 10 months old. This is too young to tax the young things with the cares and trials of maternity, and if persevered in, will certainly lessen the quantity of milk a herd is capable of producing, primarily by reducing the size of the mature cows. However, as we generally desire a fair size to accompany great milking qualities, we must plan accordingly, and allow heifers to breed early enough to be making their strongest, and best growth, just when they come to calving and milk. This time, with some breeds, is at about two years old, with others, six

months to a year later. A distinguished breeder of Princess Shorthorns not long ago remarked, that milking qualities were the easiest possible points to breed in Shorthorns, as is shown by the certainty, almost, of Shorthorn grades being large milkers, if put early to breeding, and by the fact, that in New England where they are bred and treated like cows of any other breed, or of no breed, they are all milkers. My friend was defending, or extenuating the practice of so many breeders of Shorthorns, who breed only for beef points, that is, perfection of form, early maturity, quick growth, early and quick fattening, good handling, etc.—points more difficult to secure, and to maintain, than milk giving.

Influence of the Dam and Sire.

It behooves a man who is himself a tyro in breeding, and a learner in all things, to state his own views modestly, especially when they clash with those of wise men and teachers. I have seen so many good cows that had good daughters, and daughters' daughters to half a dozen generations, all by nameless and famcless sires, that I am hardly willing to accept the view that milking qualities are more likely to be inherited from the sire's dam than from the dam herself. We can of course all remember many good cows whose calves were not worth raising, and we know but too well that very extraordinary cows rarely have daughters which equal themselves. Nevertheless, I am inclined to place the influence of the dam above that of the sire in

breeding pure stock for milk, as well as in not breeding at all, so to speak,—but in simply raising milch cows in the come-by-chance way of most farmers—that is, in breeding "scrubs." The influence of the sire in breeding for milk is, however, by no means to be neglected or lightly regarded. It is so large that many writers regard it as greater than that of the dam. In the production of grade cows, it is quite likely that the influence of the sire is the more potent in respect to milk production; but how it would be were cows of milk-giving breeds bred to scrub bulls, it would be hard to tell, for experiments are very few, and it is to be hoped that they will not be multiplied.

The Form of a Milch Cow.

A good sized udder and milk veins are invariably essential. The shape of the udder and teats is not imperative, but they must be capable of producing, storing, and delivering the milk. We all look for a well-quartered udder, for nothing is more annoying to the milker than to have one hand finish its work long before the other, which will be the case unless the quarters hold about the same quantity of milk, and the teats are about equal in size and delivery. The teats are to be squarely placed, tapering, large enough to fill a man's hand, and not fleshy. Besides this, the perfect milch cow should be capacious in body, indicating feeding capacity, thin and light before, with thin neck and shoulders, sharp withers, light head, etc. She should be lower in front than behind, because she needs room for her large udder, and length of leg to keep it from hanging too low, while it is an advantage to have short fore-legs, which brings her head nearer to business.

This gives the general idea of the "wedge shape" in milch cows so much talked about, but only in respect to the side view. The view from above would be similar, that is, broad behind, the broadest point being at the hips and thighs, and the lines converging toward the head. This matter of form is important, and it is valuable in bulls, also, as being likely to be transmitted to their daughters.

The milch cow must have bone enough in the leg to carry a capacious and heavy body. In this point they rarely fail, yet occasionally, upon rough pastures, we find that more bone and stronger joints would be of service. The head, horn, and tail, can hardly be too light, and happily we are taught to regard these, when small, as points of special beauty.

In Guernsey the proverb runs "that a long head indicates much milk"; and on that island I found especial value placed upon a broad muzzle and big mouth, on the ground that with such a mouth the animal could and would quicker fill herself and lie down, and it is quite true that then more of her food will go to milk production, and not to supplying the wastes of the muscular system, increased by prolonged exercise.

The thighs should be thin through the muscular portion above the hocks, for this gives room for the udder, and thick thighs occasion irritation in walking when the udder is distended. A thin neck and shoulders are usually found accompanying thin thighs, but not always. Meaty withers and a thick neck are a bad indication, and rarely if ever are found on a first rate milker.

The Value of the Guenon Milk Mirror.

Taken with a good udder and milk veins, good digestive functions, and capacity for food, good health, and thrift, the Guenon Milk Mirror is a valuable indication of both the quantity and duration of the flow of milk. This seems to be demonstrated by the experience of thousands who have given the subject careful study, and I have never yet met the man who ridiculed it, and called it "folly," who was able intelligently even to outline the prominent types.—The number of calves which do well or ill as milkers, very nearly as indicated by their milk mirror, is so large, that one of the principal practical uses to which a knowledge of the Guenon system can be applied is in selecting calves to raise—and of course to those who buy cows it comes equally well in use.

The enormous exports of dairy products which are now leaving the country, and for which a steady flow of gold is coming in, make it worth while for

ns to do all that we can to breed, select, raise, and use the best milch cows possible, rather than be satisfied with cows that average only 6 or 8 quarts of milk a day. Breed has much to do with this; selection probably more than breed, and many a cow which gives 16 quarts of milk a day, or even 20, eats no more than one giving half or less than half that amount. Let us keep the best; but first let us know which are our best cows.

Talks on Farm Crops.—No. 21.

By the Author of "Walks and Talks on the Farm,"
"Harris on the Pig," etc.

"It is a great mistake, Deacon," said I, "to feed the small potatoes now, when we have abundance of succulent food. They will keep until next June."

"True," replied he, "but I tell you a few bushels of small potatoes, boiled or steamed, and mashed up while hot with corn-meal, will push forward young fattening pigs very rapidly."

"No doubt about that," said I, "but will they not be worth more next spring to cook in the same way for sows that are suckling pigs? Now you have soft corn, and pumpkins, and sweet apples, and the leaves of cabbages, mangels, turnips, etc., which must be fed out soon or not at all."

With me, the fall is the busiest season of the year, and in determining how work should be done, this has to be taken into consideration. It is for this reason that I pit my potatoes in the field where they grow. Last year I had them dug by the job—paying 5 cents a bushel, and the men piled them in heaps containing about 30 bushels each. We aimed to place the heaps on high, dry ground, where the water could drain off. We make the heaps as high and compact as possible. Then cover them with straw about six inches thick, and throw on five or six inches of loose, mellow soil.

"It is a good deal of work," said the Deacon, "and it is better to put the potatoes in the cellar."

"It is not half the work one might suppose. With two teams and plows, and three men with shovels, I think I can cover 1,000 bushels in a day. We plow round and round the heap, throwing three or four furrows towards it. Then plow the same ground four or five times, setting the plow to run as narrow as possible. In this way the plow leaves very little work to be done by the shovels, and the repeated plowings makes the soil fine and mellow. The horses soon get used to it, and will go round and round of their own accord. You should have a short evener, and whiffletrees; and the right hand half of the evener should be two or three inches shorter than the left hand half, because the high horse has much further to walk than the off horse, and ought not to have so heavy a load to pull. You cannot plow too much or too deep. Loose, mellow soil is a capital non-conductor of heat."

"Then," put in Charley, "before winter sets in we repeat the operation. Last year we did it when the ground was frozen so hard that the men said we could not plow. But we found the loose soil around the heaps scarcely crust over. We covered them with straw again, and threw on another layer of earth, and did not lose a potato by frost, except in one heap nipped at night while digging."

"We had a very mild winter," said the Deacon.

"True," said I, "but no matter how severe the winter may be, a heap well covered with two layers of straw with a layer of loose earth between, and another on top, will be in no danger of freezing, and this is especially true if you are careful to plow up a quantity of loose dirt all round the heap. You cannot plow too much."

We pit our mangel-wurzels in the same way—only that we make much larger heaps.

"When we have force enough," said Charley, "to keep three teams going lively, it is real fun to harvest a good crop of mangels. We have over ten thousand bushels to get in this year, and the best we have ever had."

"You draw them in carts," said the Doctor, "and dump them into the pit?"

"No," said I, "we have sometimes done so, but we usually draw them on stone-boats, tops and all,

and top them at the pit. We have a man to help the driver to pull and load the mangels. We have three teams. One is loading up all the time, another is going back and forth, and the other is at the pit. But you must recollect that this kind of work will not run itself. You must be there to lend a helping hand when needed. There is always a weak spot, and you must be prompt in detecting it."

"I do not know what you mean," said the Doctor. "It seems a very simple matter."

Charley laughed. He knows from experience that it is not half so simple as it seems. If left to themselves the men will soon get into a snarl.

"Sometimes," I replied, "the man and driver who are pulling and loading the mangels will get behind. That is the weak spot, and you must take hold and help for a few minutes, and put a little more snap into them. Then again, the men at the heap will not get through topping in time, and there will be two loads there instead of one. That is a weak spot; and you must be on hand to help the men tip over the stone-boat and let one of the teams go for another load of mangels. In this way you can make everything work smoothly, and your head will be worth two pair of hands—especially if you use your hands as well as your head!"—"What do you mean," asked the Doctor, "by a pit?"

"Nothing more," said Charley, "than a deep wide dead-furrow. We make it by plowing three or four furrows on each side of the center of the proposed pit. We repeat this three or four times, forming a dead-furrow four or five feet wide and two feet deep. A little work with a shovel levels off the bottom, and the 'pit' is ready for the mangels. We build up the mangels, about four feet above the level of the ground, like the roof of a house, and cover them with straw and earth, just as we do potatoes, but with less soil and more straw for the first covering, as the straw absorbs the moisture from the mangels. Last year we had so much warm weather, that the mangels commenced to grow before Christmas, and we had to open the pits. But we did not lose a dozen mangels out of 10,000 bushels, either from freezing or heating."

"I think the danger of heating has been greatly overestimated," said I. "The real point, as Charley says, is to use a plenty of straw for the first covering, and only soil enough to keep it in place, say three inches thick. You want to use the plow freely for four or five feet on each side of the pit. Do not let the mangels freeze, but the nearer they come to it, the better. The leaves not wanted for feeding, are thrown on the sides of the heap. The pit can usually be left in this way until about Thanksgiving Day. Perhaps if you do the work a few days before, you will have an additional reason for thankfulness. We cover the mangels as we do potatoes, with two coats of straw and two layers of soil. If the work is delayed until the heap is reduced nearly to the freezing point, you need not, in ordinary winters, trouble yourself about ventilators, though we usually make a ventilator every eight or ten feet, by pulling some straw up through the layers of soil."

"You have a famous lot of cabbages," remarked the Deacon, "I suppose you will try to winter them."

"Yes," said I, "and the more cabbages I raise the better I like the crop. We have over 25,000 head this year, and the cows and sheep must regard them with fond anticipation. If we have as good success in keeping them through the winter as we had last year, I shall put out more next season. There is very little trouble in harvesting them, and they are a valuable food in the early spring."

"We plow out a deep dead-furrow," said Charley, "put two or three cabbages abreast, heads down, and then with a plow, set narrow, throw several furrows of soil on them, finishing with a shovel."

"Not forgetting," said I, "to plow the ground on each side three or four times over, and as deep as possible. You cannot have too much fine, mellow soil about them. But the later you do the final covering the better. Be very careful not to bury them where there is any danger of standing water."

"We had capital luck," said Charley, "in keeping our cabbages for seed last winter. We saved about a hundred of the largest and best heads in the field, and put them into a dead-furrow, like the others,

except that we put the roots down. We only lost two cabbages out of the lot. I should think every farmer would raise his own cabbage seed. It is very little work. When we were setting out our mangels for seed, in the spring, we set out a row of the cabbages. The rows were 3½ feet apart, and the cabbages 2½ feet apart in the row."

"Before winter sets in," said the Deacon, "you must attend to your corn-fodder. I suppose you intend to let it remain in the field, and draw it as you want it in the winter."

"Yes," said I, "we know that is a good plan, though I presume we shall some time discover a better. We cut the fodder with a self-raking reaper that threw the fodder into bundles ready for binding. We have about 15 acres, all of it good, and some of it so thick and tall that we thought the reaper would not cut it. But it did the work far better than it can be done by hand. We let the bundles lie a few days to wilt, and then bind them up just as we do wheat, and then set them in stooks holding about a dozen bundles. We shall put nine of these stooks into one, and put a couple of bands around it. Mr. Hooker uses willows for bands. When these cannot be had, tarred rope is good, which afterwards, if saved, will be found very handy about the house and barns. In tying these large stooks, we use, to bring them into shape, a quarter-inch rope, about 15 feet long, with a loop at the end, this is put around the stook and drawn up tight, and then the tarred rope is put out, and the other removed. If the work is properly done, the stooks will shed the rain and the fodder will keep perfectly. The only difficulty we have experienced, is from the butts of the stalks freezing to the soil. This is especially the case if the stooks are made when the ground is soft and muddy, which work should be done while the ground is dry and hard. The stook should be made as upright and compact as possible. It is a job that the farmer must see to himself. It requires a little common sense."

"The farmers of New England and Eastern New York," said the Doctor, "will yet raise great quantities of corn-fodder not merely for milch cows, but to fatten sheep in winter."

"They cannot fatten them without grain," said the Deacon, "and the Western farmer will always have the advantage of getting cheaper corn than the farmers of the Eastern States."

"That is true, but Eastern farmers can buy deoorticated cotton-seed cake cheaper than those of the West can. And there is nothing better for sheep, and nothing that makes richer manure than that. Corn-fodder and cotton-seed cake will enable the Eastern farmer to fatten sheep in winter with great profit. We could ship thousands of sheep to England every week, if we only had those that were good enough and fat enough for the English market. Good mutton is worth more in England than beef, and live sheep will stand the voyage better than live cattle. Ten acres of corn-fodder and ten tons of deoorticated cotton-seed cake would fatten 200 sheep, with say a ton of hay and two tons of bran for an occasional change of food. There is money and manure in the business."

"Yes," said the Deacon, "and there is clean land and a better and higher system of farming. A good crop of corn-fodder will clean land better than a summer-fallow."

"I am not so sure about that," said I, "but at any rate I know of no crop that leaves the land in such admirable condition for barley, or potatoes, or mangels, or spring wheat. My corn-fodder this year is on old sod land that has not been plowed for many years, and we did not put a hoe into the field; we cultivated once between the rows, but could not a second time, as the corn got too big for the horse to get through. The land now is in splendid condition, with scarcely a weed to be seen in the entire field. The sods have withered nicely and the soil has a remarkably rich look. The corn-fodder shaded the ground completely, and this is favorable for decomposition and nitrification."

"But much of the land in New England," said the Deacon, "is too stony and hilly to plow."

"Very well," said I, "then pasture it with sheep, and give the sheep from half a pound to a pound

each of cotton-seed cake daily. The sheep then make rich manure, and carry it on to the hilly portions of the land, where it is so much needed."

An Improved Road Scraper.

If the operation of an ordinary road scraper is observed, it will be seen that it is faulty in one important point, viz., that it leaves the hollows as it finds them, if indeed it does not scrape them out deeper. It simply smooths the surface, but does not level it. By the simple addition of runners, by which it is kept from falling into the hollows, it will draw earth into them, instead of scooping them out. The runners are raised an inch or two

FOR LEVELING ROADS.

above the bottom of the scraper. It will thus scrape up the loose soft earth and deposit it where needed, that is, in the hollows, thus leveling as well as smoothing the surface. The form of the improved scraper is represented in the engraving.

Chest for Steaming Timber.

An apparatus for steaming timber for bent work, such as ox bows, hames, ribs for boats, etc., or for basket work, may be constructed as follows: A box of 2-inch plank, is made of sufficient length, and about 12 inches wide and deep. Three cross bars are fitted at the points shown in the engraving, and about an inch above the bottom. The timber rests upon these so as to expose every part to the steam. The movable door is held in place by bars, passing through staples as indicated in the engraving. The box rests upon trestles about four feet high. A common cauldron or boiler may be used to make the steam. This may be hung upon a tripod, or set in a rough arch of stone. A wooden cover is fitted to the top and held down by clamps or weights. A pipe made of wood or metal, connects the boiler with the steam box.

CHEST FOR STEAMING TIMBER.

dance, he would "occasionally place a handful of leaves on the ground in the yard, the cows would drag it around, the pigs eating it *all*, (as I supposed); but since it got more plentiful, I one evening placed a good armful on a high platform, where the cows could reach it, but the pigs could not. The first night I could not see that any had been eaten, but it was dragged about the yard; the next evening another fresh armful was given, and nearly all eaten. The third night another lot was eaten entirely; since then we have been feeding regularly, each evening, about 50 lbs. per cow, the cows being in pasture during the day."—Mr. G. A. Wilcox, Gasport, N. Y., experimented with $\frac{1}{2}$ acre, and while the plants were a fine sight, none of his animals, save pigs, would eat it. Being determined to ascertain whether the plant was an-out-and-out humbug, or if it were not the strangeness of appearance and smell that caused them to refuse it, Mr. W. went systematically to work, and met with most gratifying success. As there are no doubt others who have the plant and can not utilize it, we give Mr. W.'s method: "To teach stock to eat it, they should be confined, and after they have fasted over night, give them the Comfrey prepared as follows: Run some leaves through a cutting machine, or cut them up with a butcher-knife; wet the cut leaves and mix bran or meal and a little salt with them; feed this, and when it is eaten, give hay, then again some of the Comfrey and so on, but gradually increase the Comfrey and decrease

to receive 3-inch bars, placed three inches apart. The ends of these bars are also rabbeted to match the frame, and are securely nailed in position. Pieces of wood are fitted into the rabbets, between these bars, as a finish. The door should be hung with weights, as shown, so that it may be raised to open it, and when not in use will be out of the way. An extra door of this kind, which may be fastened, will be found very useful in the summer time, when free ventilation is much needed.

Prickly Comfrey—Failure and Success.

Having been the first in this country to describe and figure Prickly Comfrey, we should have been glad to record its complete success. Our first knowledge of failure came from our own experience. As already stated, the plant grew and produced abundantly, but the cows would not eat it at all, and the horses, which accepted it at first, refused it after they had been once or twice at pasture. Similar complaints came from others, while some correspondents wrote of it in high terms. The case seems to stand at present, thus: The plant, so far as heard from, is hardy, produces abundantly, starts early in spring, and soon gives a cutting, withstands the drouths, and is not injured by moderate frosts, but gives fresh feed quite late in the season. On the other hand animals, in the case of cows probably the majority, will not eat it, but by taking a little pains to make them acquainted with it, they soon acquire a taste for, and consume it readily, and it appears to be a nutritious food. The question seems to be: are its good qualities sufficiently marked to make it worth while to be at the trouble of teaching animals to eat it? As an aid to a decision, we give the experience of two correspondents, both of whom at first met with failure. Mr. Frank Spencer, Oakland Co., Mich., some two months ago wrote complaining of the Comfrey as a humbug; he has since written that he had decided too hastily, "having had better experience since then." At first, not having an abun-

the ground feed and hay. In three or four days Comfrey may be fed exclusively, and stock will become more fond of it daily. Cows will take to it readily in the spring before going to grass; when they once acquire a taste for it, they do not forget it. It will improve the yield and flavor of milk very much. Comfrey and water will grow pigs fast. Sheep will fill themselves so full that they look bloated, but not the first time it is offered to them. I have 2,000 plants in a rayne, fenced in; they were making a rapid growth, and when they were three months old the cattle broke in, and before they were discovered, had eaten every leaf and spear; as they left good pasture for this, it does not look much like forcing." Mr. Wilcox sends us testi-

A SUPPORTING HALTER.

monials from the President of the Niagara County Farmer's Club, and other citizens, to the effect that they selected three plants of Comfrey in his field, cut the tops, and weighed them; on the 1st of July following, they cut the same plants again; total amount of the two cuttings 61½ lbs. They also testify to the readiness with which it was eaten by his animals. At this rate the yield up to July 1st was more than 49 tons of green fodder to the acre.

Mr. Ashburner, of Va., writes that the leaves should be treated in the same manner as clover; but that, if very succulent, they will take a few hours longer to cure. He suggests sprinkling a little salt over it when stacking the cured leaves.

Halter for Swimming Horses.

A frequent necessity of swimming horses across streams in new countries, renders desirable a properly constructed halter for the purpose. That here described is not only useful for securing the horse, but also for supporting its head from a boat, when necessary because of weakness from long swimming, or an attack of cramp. The halter (see the engraving above), is made of a rope 30 or 40 feet long looped at the middle. At the upper part of the loop is a throat latch, which is fastened by passing the short wooden bar through the small loop. Under the nose-band is a piece of netting, so fastened as to come under the horse's lower jaw, and support the head when needed. A halter of this kind is used for landing army horses in the East Indian ports, at which, having no harbor, ships are obliged to anchor two or three miles from shore. They are also used in crossing the large rivers of that country where there are neither fords nor bridges.

Cultivator for Wheat.

Those who desire to test the question of cultivating wheat, may provide themselves with a simple

TEMPORARY WHEAT CULTIVATOR.

implement for the purpose. Wagon shafts are fitted to a piece of 4x4 timber, which is provided with a pair of short smooth runners, as shown in the engraving. Wooden teeth sloping forwards are inserted into the timber; and a pair of handles,

Ventilating Door for a Stable.

A secure stable door through which a current of air may be admitted, is made in the following manner.

TO SECURE VENTILATION.

The engraving shows a frame of inch and a half timber, with an inner cross-piece. The inner edges of the frame, and both edges of the inner cross-piece, are rabbeted for one inch in width,

consisting of simple straight rods, affixed. This may be put together in a short time, and will allow the question, whether or not it is desirable to go to further expense for a more complete and effective implement, the "wheat-hoc," to be fairly tested.

A Cider and Vinegar House.

A plan for a building devoted to the making of cider and vinegar, is given in the accompanying engravings. It may be made of any desired size,

Fig. 1.—CIDER HOUSE—UPPER FLOOR.

but if less than 24 feet wide, it will be found inconveniently narrow. The upper floors, and the roof, should be made high,—at least 9 feet—that it may be airy. The upper floor, shown at fig. 1, contains bins *a, a*, for the storage of apples, and to hold the pomace, *b, b*, for 12 to 24 hours, for mellowing and coloring; a grinding mill, *c*, and a trap, *d*, with shoot leading to the press below. A wide door should be made at both ends, and a window in each bent upon either side, with slatted shutters, for ventilation and shade. The lower floor, fig. 2, contains the press, *D*, and frames, *E*, to hold the barrels. These frames, or skids, consist of parallel timbers, fastened together by cross pieces mortised or dovetailed into them, and raised 18 or 24 inches above the floor, by short posts, or legs. A second tier may be built up above the lower one, and perhaps two or three feet in the rear, so that the cider may be readily drawn from the upper into the lower barrels. The bins for the apples should be made of open slat work, and the bottom raised a few inches from the floor, and sloping from back to front. Then the apples gravitate to the front and lower side, rendering the emptying of the bin an easy matter. This form of bin also prevents the heating of the apples, and keeps them in the best condition.

Ice.

Every year the use of ice on the farm increases; and it is surprising, with all that has been said and published on the subject, that every farmer in the land has not some means of keeping a store of ice for summer use. Ice is not merely a luxury, but it becomes a necessity so soon as its value is known

Fig. 2.—CIDER HOUSE—LOWER FLOOR.

by experience. As with many others of nature's gifts, however, its very abundance causes it to be disregarded; and this mine of usefulness is formed once a year, perhaps almost at the farm-house door, and is allowed to pass away in spring unworked, save by not more than one farmer in ten. Ice in the dairy is next to indispensable, for holding milk at a proper temperature, and for use in working and keeping butter. This

fact is recognized in all well regulated dairies, and especially in those where high-priced butter is made. Successful dairymen state that the gain in the price obtained for their products by the use of ice, many times repays the cost; and in preserving meats, etc., its worth is to be estimated by computing the total value of the things kept from spoiling. Numerous plans of substantial ice-houses may be found in the fall and winter numbers of the *American Agriculturist* of past years. Figure 3, illustrates an ice-house that can be quickly erected at a very slight outlay for materials, and at the cost of only a few hours' labor. The size is determined by the length of the planks or boards to be used. Nine posts, rough, sawed, or hewn, of suitable height are provided, and two put up at each corner, as in figure 2, resting upon a block of wood or a stone, or set in the ground. At one side of the front, the ninth post is placed, to serve as one side of the door; the bottom planks all around, are nailed to the posts, which may be more firmly secured in place by cleats connecting those at each corner; the front posts are a foot or so longer than the others, to permit of a shed roof. A plate of light scantling secures the tops in place. Now it is ready for the ice. First, put on the ground a layer of sawdust, shavings, or cut hay, so that it will be at least six inches deep, when firmly packed down. Then put in the first tier of ice, keeping the blocks a foot away from the plank wall; fill the space solidly with the saw-dust or other packing material (*a*, fig. 2); then the second tier of ice; next, put in position more planks, and so on, until the house is filled; storing the ice, and carrying up the wall together, and filling in between with saw-

Fig. 1.—ICE-HOUSE AT DONALD G. MITCHELL'S.

dust, etc., as the work progresses. The planks need only be slightly nailed, to keep them up when the ice is removed, as they will be held in position by the posts without, and the pressure from within. A door (*b*), is made by simply using two lengths of plank on the front side, as indicated by the posts in fig. 2. When the house is full, a thick layer of the packing material is also put on top of the ice. Drainage is secured by placing the structure on sloping ground. A roof of slabs, a thatch, or anything to keep out rain, is sufficient. With a little care and taste in the construction, this may be made quite pleasing in appearance—as by the use of unhewn cedar posts, and making the slabs of the roof of even length, and to project at the eaves considerably. Fig. 1 represents an ice-house seen on the place of Donald G. Mitchell, made picturesque by a roof and ends of rough slabs. The main part of the ice-room is below the surface of the ground, and may be constructed of stones or timber. An ice-house like those suggested here, or even one of greater pretensions, may have its appearance improved by the free use of climbing vines; these answer not only as an embellishment, but serve a useful end in breaking the force of the sun's rays and keeping

the building much cooler than it would be under full exposure. It costs no more to make the smaller farm buildings tasteful and picturesque in appearance, than to have them look ugly and cheap.

Farmers' Clubs.

Make Use of the Knowledge of Your Neighbors.

The season of fairs has passed, and with most satisfactory results. Farmers who have attended have gained much in knowledge of the methods

Fig. 2.—GROUND PLAN OF FIGURE 3.

and experience of others. Premiums won are satisfactory evidence of the correctness of the system which produced the winning articles. Failure to win should teach us how to improve our practice, that we may obtain better results. Many have found personal contact and conversation with others to be one of the best features of these exhibitions. And it is this phase of the fairs that may and should be extended through the winter by means of farmers' clubs. A large number is not essential to the success of such an organization; nor even is an elaborate constitution necessary. A half dozen interested men meeting once a week at each others' houses, to talk over farm matters, will derive much good from the association. Of course, the larger the number participating in the discussions, the more valuable will be the results, and as many as possible should be induced to join. From a half dozen upward, the simpler the organization the better. Where there are a constitution and by-laws, much time will be wasted in amending and tinkering them. An assemblage of farmers needs only the rules of common courtesy to govern it. We once heard Agassiz say: "Why all this talk about by-laws, a company of gentlemen need no by-laws." A large association will of course need some rules, but the fewer and simpler these are, the better. A good way is, to have the host as chairman of the meeting at his house; it should also be agreed upon

Fig. 3.—CHEAP AND PICTURESQUE ICE-HOUSE.

at each meeting, what is to be the question for discussion at the next, and the place appointed. Then let the talks be quite informal, with no special leaders, each putting in his word according to his knowledge, and as opportunity may offer, guided as to time, however, and lead on by the chairman.

This small beginning may lead to a large organization; requiring by-laws and regular officers, and meeting in a hall. But the first will teach how to manage the more cumbersome affair. The social element is not to be forgotten in any case; for the sons, and wives, and daughters will enjoy, and add to the enjoyment of the meetings. It is this feature which makes the Grange the success it is, in some localities, and the same is true of many successful farmers' clubs that we are acquainted with.

Where means and numbers permit, it is a very wise plan to have a library, which, if no hall is held by the society, can be in charge of the village postmaster. Fifty dollars, or even less, will purchase a nucleus for a good library, which would add interest and give more permanency to the club. It is well to exhibit at the meetings specimens of farm products, for comparison and criticism. Oftentimes one can learn more by the intelligent comparison of specimens produced by different methods of practice, accompanied by statements of yield and culture, than by hours of discussion. No occasion is more favorable for this than these small meetings where there is not much else to distract attention.

The large number of farmers' clubs which we hear of as being organized, as well as the Grange movement, is evidence that farmers are growing in the idea of association as a means of advancement and profit—a fact which commerce and the trades have long held as a cardinal principle of success. The isolation of farmers renders it of even more importance that they should associate for mutual strength and instruction, than for the people of towns. Farmers should club together if for no higher motive than mutual protection against the various imposters and swindlers that too often find them an easy prey. A farmer who feels that his neighbors will make common cause with him in such cases can more effectively resist the demands of sharpers than when alone and unaided. But, beyond and above this, such organization and co-operation gives impetus to thought, diffuses intelligence, creates ambition to excel in farm practice, adds more of interest to the calling, makes it really higher and nobler, and finally results in greater success, larger crops and subsequent profits, greater happiness, and develops and strengthens in the young their natural love for the farm and the country.

Cider Vinegar.

The vinegar that we daily use is, or should be, a weak acetic acid. It is a well established fact that much diluted strong acids, such as the sulphuric (oil of vitriol), have been sold as a substitute for vinegar, on account of greater cheapness. Though we have never seen any of this false vinegar, the examinations by "Boards of Health" leave no doubt that it occurs, and consumers should be on their guard against it. Vinegar being acetic acid, the only practicable method of preparing this outside of chemical laboratories, is from alcohol in some form. By the action of the oxygen of the air upon alcohol, that compound is broken up, and a new one—acetic acid, results. All our vinegar making has for its object the free exposure of some weak alcoholic liquid to the air. The source of alcohol is sugar, and whether we use the juice of apples, grapes, or watermelons, or maple sap, whether molasses and water, or other sugary liquid, the changes are: first, the formation of alcohol from the sugar in these liquids, and next, the conversion of the alcohol into vinegar. In one method of making vinegar, alcohol, in the cheap form of whiskey, and largely diluted, is the material used. Whatever sugary or alcoholic liquid is employed in vinegar making, the product, so far as the sourness—the acetic acid—goes, is exactly the same in all. If alcohol (in the form of whiskey) and water are used, the vinegar will be nearly colorless, and of a pure sour taste; if the sugar in apples (cider) is used, the vinegar, besides being sour, has an aromatic quality, or fragrance, belonging to the apples, and will also be colored, while that from wine and from molasses each has a different but peculiar flavor. The domestic use of vinegar is for two purposes: to preserve vegetable substances—pickles—and as a

condiment to eat upon various kinds of food at the table. For pickles the chief requisite is a proper strength, and though a high-flavored vinegar will make better pickles, its color is an objection, and many persons, for the sake of the looks, purchase for their pickles colorless whiskey vinegar, under the name of "White Wine Vinegar," sacrificing quality to appearance. Whiskey vinegar is just as wholesome as any other, but is quite without the peculiar aroma of cider vinegar, which all who are good judges of such matters prefer for table use. To convert any sugary or alcoholic liquid into vinegar, this liquid must contain sufficient alcohol, or sufficient sugar to make the required alcohol which

VINEGAR GRADUATOR.

is to be converted into vinegar. No process of manufacture will make vinegar out of a liquid that does not at the outset contain the materials to make it from, either in the form of alcohol or sugar. Our present purpose is with Cider Vinegar, and though apples vary greatly in the richness of their juice, even common fruit contains enough sugar—though disguised by the acids in the apples—to make vinegar sufficiently strong for family use, while the best apples are so rich that the resulting vinegar will be unpleasantly strong, and may be properly diluted before using. The ordinary method of making vinegar is to put the cider into casks, open at the bung, and leave it until the change takes place spontaneously, which may be one or two years, or even a longer time, according to its strength and the conditions under which it is exposed.

The conversion into vinegar may be greatly hastened by increasing the exposure of the cider or other liquid as thoroughly as possible to the air. One method of effecting this, and which was patented a few years ago, was to pass continuous streams of fine bubbles of air through the liquid by means of a force-pump. Another method is to allow the cider or other liquid to slowly trickle over a series of inclined shelves inclosed in a box or closet; an apparatus on this principle has been patented. Another method is to allow the liquid to pass slowly over shavings packed in a vat or cask, in which are holes near the bottom to allow an upward current of air; beech-wood shavings are preferred, as they impart no flavor; maple is next best. What is sold for "White-wine Vinegar" is made with whiskey, water, and some old vinegar as a ferment, passed through such a "graduator" as it is called. This process, which is only profitable on a large scale, is too full of details to give here, but the same principle may be used to greatly aid in converting cider into vinegar. A cask has a row of inch holes bored near the bottom, these should be made with a downward slant, there should also be several holes in the bottom. The cask is set upon a board channeled with grooves to convey the liquid to a pail or other vessel, as shown in the engraving. Shavings of beech or maple are made with a double-ironed plane, so set that they will be rather thick, and have a strong curl; in the absence of these woods, corn-cobs may be used; either shavings or cobs should be well washed, dried, and soaked in strong vinegar. The cask (the head being removed) is filled with shavings, placed in closely, but not crushed; or cobs laid in

regularly, each layer crossing the last, filling the cask to within a few inches of the top. A tub of suitable size for the top of the cask has a number of holes bored in the bottom, through which the cider will trickle slowly; if too small, these holes will clog up from the swelling of the wood, or from impurities in the cider, and it is better to make them with a large gimlet, and partially stop them with sticks whittled to fit irregularly, to allow the cider to pass, or pieces of lamp-wick, with a knot in the end, may be drawn through them; any contrivance that will allow of a slow trickling will answer. The tub should not fit the top of the cask closely, as there must be a space for a current of air. Cider being placed in the tub, will fall slowly upon the shavings or cobs, spread over them, and expose a great surface to the air; the chemical action of the oxygen of the air upon the cider causes heat, and the air will rise, thus starting a current, fresh air passing in through the holes below, to replace that which passes out between the tub and the edge of the cask. By passing cider successively through the cask, or through a series of three or four of them, it will soon be converted into good vinegar. The chief use of this "graduator" is to aid in vinegar making, rather than for making it solely by its use. The vinegar house should be heated by a furnace or stove to 75°; the casks or barrels must not be filled within several inches, in order to allow a wide surface to be exposed to the air; in regular establishments, where there is old vinegar, a few gallons are added to each cask of cider. Heat being kept up and regular, and proper ventilation provided, the vinegar will "make itself," but from some unexplained cause, some casks of cider will be slow to undergo the change, or as vinegar makers say, are "lazy." The "graduator" is used for these lazy casks, the cider being passed through it, will get a start, and afterwards go on without trouble.

Composts.

A mass of green manure and refuse of the barnyard are piled in a heap, and shoveled over several times in order to mix the various substances; to pulverize the coarse lumps, and especially to check and prevent overheating. Green stable-manure contains little or no plant-food, that is to say, the elements of plant-food contained in it are not in a form at once available to plants, either chemically or mechanically. When put into a compost heap, however, the oxygen of the air permeates the mass, and, by aid of moisture, causes decomposition, which destroys the structure of the bits of straw and undigested fodder, and changes the coarse material into a fine mechanical condition, and also changes it chemically, so that its plant-food is readily available to crops. The same changes occur when green manure is applied to a light porous soil, in which air has free circulation; while in a heavy, compact soil, it decomposes but slowly.

There is considerable discussion at this time as to the economy of composting manures. Either side would see that the other was right, if both could look over the boundary fences of their farms, and note the different effect of manures in varying soils. The sandy-land farmer finds that green manure acts so quickly, that composting is too expensive for the scarcely perceptible increase in the activity of the manure; while with the clay-land farmer, green manure is so much slower of action than a well-rotted compost, that the labor expended on the latter, gives a handsome return in the luxuriance of the growing crops and more abundant harvest. The discussion is but the old story of the shield with two sides. There is, however,

Too Much Labor

expended on composts. The repeated turnings of the heap with fork and shovel, are for the purpose of mixing and pulverizing to prevent overheating. Now "heating" is only rapid oxidation, and to check it, we have but to control the admission of the oxygen of the air to the interior of the mass; this may be done by compacting the surface of the heap with the shovel or feet, and covering it with a thin layer of earth, also patted down firmly with the shovel. Then, there will be a slow decompo-

sition, with no "fire-fanging," which will change crude material into plant-food, and cause the coarse portions to rot and fall to pieces. The opening and turning of the heap effects the heating only for the moment, while it gives free access to the air, and results in even more rapid oxidation and "heating" than before. Aside from once or twice turning, to thoroughly mix the contents of a general heap—if only clear stable manure is used, no mixing is necessary—all labor spent in working over a compost heap is wasted. We have proved this by experience, and when the cost of labor in making compost, by the old method, is \$2, if not more, per cord, it is a fact worthy the attention of the readers of the *American Agriculturist*.

Hoisting Apparatus.

Several enquiries are made for a hoisting apparatus for barns, stables, and granaries. The one here

Fig. 1.—A "HOIST."

described may be easily made and readily affixed to the frame. Two posts, six or eight feet apart, are fitted to the timbers of the top floor and upper beams. A wheel is made of three thicknesses of one-inch boards bolted together; the outer ones extending $1\frac{1}{2}$ inch beyond the inside piece, thus forming a groove for the rope to run in. The edges of the groove are beveled off, so that the rope will

neither be pinched, nor rise, and be thrown off, but will work easily in it. An axle is framed into the wheel, and a flange fitted to its end, to keep the hoisting rope in place. At each end of the axle are wing gudgeons which work in boxes bolted to the posts, as shown at fig. 1. On the post are a pair of round blocks turning upon pins, to hold the wheel-rope when it is desired to suspend a weight upon the hoisting rope for any purpose. The rope being placed between the blocks, they pinch and hold it as they are drawn together. The pulley wheel should be 8 feet in diameter, and the axle 8 inches; this will give one man twelve times his natural

Fig. 2.—SIDE VIEW.

lifting power. Where more power is required, enlarge the wheel and decrease the axle, or either may be done with a proportionate gain. At fig. 2 is a side view of the hoist with the "eat-head" over the door outside, for the rope to pass over.

Physicians as Veterinarians.

A student in his last year at the medical school endorses the course of the *American Agriculturist*, in advocating the introduction of veterinary studies into medical schools, and of physicians treating dumb animals as well as men. He writes: "You speak of the 'false pride of the doctors.' That may be the case with some, but the difficulty often lies with public opinion. There are plenty of tender hearted physicians, who possess the requisite knowledge, and would take pleasure in giving relief publicly to suffering animals; but I know of cases where it is thought necessary to treat them on the sly, the owners promising secrecy. I am a medical student in my last College year, having a knowledge of comparative as well as general anatomy, and an understanding of the commoner diseases among domestic animals.

This summer I undertook the treatment of several horses and was quite successful. For this I was censured by half the old ladies, as well as a great many men. As a student in his last year I am allowed to practice, and have had many cases, and some admit having received benefit from my treatment. Yet the influence of their acquaintances was so great, that I was discharged by them because I dared to give relief to a suffering brute. In fact many would hurt me all they could, saying, 'He's only a horse doctor.' Is it any wonder that physicians fight shy of such criticism? I have not the least doubt, if the public would consider it honorable for a physician to relieve suffering anywhere that life exists, that the Medical Colleges would not be slow to take up more of the diseases of the brute and their treatment. It is my intention to, if possible, practice on man or beast, giving relief wherever pain is found, pay or no pay."

[There are "horse doctors" and horse doctors; or the line is now drawn between "horse doctors" and veterinarians. If a calling is not respected, it is because of the men who fill its ranks, and occupy its offices. We know of veterinarians who are as much respected as any physician in their town or city, and of those who practice upon all kinds of animals, both human and brute, without detriment to their standing. If physicians are thoroughly educated in, and fitted to practice, veterinary medicine, there is little danger that public opinion will be long against them. They have only to persevere in their course, and show their ability and respectability, in order to be respected, and to have all the work they can accomplish.—EDS.]

Success in Breeding.

BY CHAS. P. LYMAN, V. S.

Breeding from unsound stock, especially horses, is a serious, yet common mistake of farmers. No rule is better established, than hereditary transmission of qualities; and this does not mean that actual disease is communicated, but merely that such peculiarities of constitution, or form, are handed down from generation to generation, as renders the offspring extremely liable to the same diseases as their parents, whenever they are exposed to suitable exciting causes. No one would, of course, believe in the transmission of a deformity from an accident, as a broken limb, or a dislocated joint. But, in considering the purchase of a breeding mare, or the use of a certain stallion, be careful of what is admitted into the list of accidents; do not be imposed upon by the assertion that this spavin, ringbone, curb, heaves, or roaring, occurred from a wrench, strain, or fall, violent or sudden over-exertion, for which the animal is not to be blamed. Trust invariably to the mare, or stallion, that goes through her or his work, at all ages, sound, and turns up sound at the last. Such can speak for themselves, and need no apologies for this or that ailment. Some diseases are so trivial, that they need not to be taken into the account; but many others are so serious that they should never be overlooked. Broken wind, ringbone, navicular disease, curb, spavin, and serofulous diseases of the joints (found especially in cattle), periodic ophthalmia, cataracts, etc., are so important, and so decidedly hereditary, that they should always be considered, unless known circumstances tend to mitigate the general rule. Temper should always receive special attention: a fractious, fretful, dogged, or vicious disposition is so vexatious as to be a great drawback on both the value and usefulness of the animal. No consideration should induce any one to breed from an animal with a "soft" constitution; and there should always be plenty of substance and size to suit the purposes for which the progeny may be designed. Choose animals of a medium age to breed from, as they generally produce more vigorous, healthy, and thriving offspring than the very young or the very old, though there are some notable exceptions to this general rule. It is claimed by many, that there is no foundation for the prejudice, in some quarters, against in-and-in breeding. On the contrary, it has been plainly

established, that within certain limits, this plan is highly advantageous, when the stock is of the right sort. Some writers go so far as to say that there is no other way in which the perfections of any particular strain can be so certainly retained as by returning frequently to the original blood. When out-and-out crossing is strictly followed, the tenth generation contains only $\frac{1}{1024}$ th of the original stock; shown in tabular form as follows:

1st.	Off Cross	contains	$\frac{1}{2}$	original blood.
2d.	"	"	$\frac{1}{4}$	"
3d.	"	"	$\frac{1}{8}$	"
4th.	"	"	$\frac{1}{16}$	"
5th.	"	"	$\frac{1}{32}$	"
6th.	"	"	$\frac{1}{64}$	"
7th.	"	"	$\frac{1}{128}$	"
8th.	"	"	$\frac{1}{256}$	"
9th.	"	"	$\frac{1}{512}$	"
10th.	"	"	$\frac{1}{1024}$	"

The practical results, of course, will not always follow this arithmetic, because some certain horse may stamp his form so completely on his offspring, that it will not be easily gotten rid of; but still it will run out in the course of time, and the more complete and violent the cross, the sooner will the peculiarity disappear, and it can only be retained by frequent returns to the same blood. By bearing these few facts in mind, and acting upon them with judgment, the breeder can reap all the advantages of good stock, without running in-and-in so constantly as to hazard the deterioration of his animals; on the other hand, if there is any special defect, he will be able to breed it out. In short, this just amounts to the fact that "like begets like"—shown plainly when looked at in a more marked degree—as, who would expect a Short-horn calf by an Alderney bull from an Alderney cow? and this is no more absurd than to expect a first-class foal from inferior parents. Again, the fault of looking to pedigree alone, has caused much disaster amongst breeders; good blood is a good thing, but it is not soundness and perfection of form, and does not supply their place. Never breed from an unsound, or ungainly animal, thinking that *perhaps* he will "throw back" to his sire, grand-dam, half sister, or some other renowned relative of the past. By all means keep to the good blood, but select its best specimens, for this alone will give success, or history falsifies herself.

A Cure for Choking or Bloat in Cattle.

When cattle are bloated in consequence of the accumulation of gas in the stomach, from eating greedily of wet grass or clover, or they get choked by the lodgement in the gullet of an apple, a small turnip, or other obstate, some mode of immediate relief should be applied. An effective means is to insert a round billet of wood between the jaws, fastening it by cords to the horns or around the

GAG TO CURE BLOAT OR CHOKING.

head. The billet should be large enough to force the mouth wide open, and cause efforts on the part of the cow to rid herself of the innumerable. In these efforts, during which the cow will raise her head, much of the gas will be discharged, or the obstacle in the throat will pass downwards. Vigorous and continued pressing of the abdomen with the hands will assist in the expulsion of the gas.

"Pampas Rice."—Drooping Sorghum.

Seeds of a grain under the name of "*Pampas Rice*" have been offered for the last two years in such papers as would admit the advertisement. Small towns in Tennessee were headquarters for Durra Corn (*Sorghum vulgare*), offered as "Ivory Wheat," and by other tempting names, while "Pampas Rice" had a town in Michigan for its "head center," where this remarkable grain rested on its way from the Pampas of South America to take a fresh start among the farmers of North America. Judging from the description and very poor engraving accompanying the announcement of "Pampas Rice," we supposed it might be a variety of *Sorghum vulgare* or "Durra Corn," and in an article on that grain in February, 1877, we stated that such was our opinion, though we had not seen the plant, or a flower-cluster—nothing but the grain. Mr. J. F. Hilgard, of Mount Holly, N. J., tested this "Pampas Rice" on the soil of New Jersey, and supplied us with abundant specimens in all stages of development. An examination shows this "Rice" to be the "Drooping Sorghum," *Sorghum cernuum*, which differs from the common Sorghum, *S. vulgare*, in two not very important respects: the top of the stalk, as the flower-cluster develops, bends over in a regular curve, in such a manner as to invert the cluster and make its top point directly downwards, as shown in the engraving. This curving is not due to the weight of the head, or cluster, as it occurs long before the grain begins to fill—even while the plant is in flower. The other difference from the Common Sorghum, is in the length of the stalk to the male flower. Neither of these points is of sufficient importance to make a species upon, and we have little doubt that they are forms of the same. Indeed, Trinius, some 50 years ago, though he described these and the Sugar Sorghum as distinct species (Trinius, "*Andropogoneorum Genera et Species*"), says that they appear to be all forms of one. The stalk in "Drooping Sorghum" grows about seven feet high, and as it has abundant foliage of a grayish green color, a field of it presents a striking appearance. With the exception of its inverted position, the cluster in flower, and when ripe, is like that of Durra, and the grain appears to be identical. With the other Sorghums, this appears to be known only in the cultivated state; as they all contribute largely to the support of the native population of the East Indies and Africa, they probably originated in one or the other of those countries. As stated on a former occasion, we have no objection to the cultivation of this grain or the sale of its seeds, but we most earnestly protest against selling it under a false name, indeed doubly false, as the plant is not, as has been asserted, a native of the plains of South America, nor is it a "Rice," or anything like a rice, and to sell it as such is to obtain money under false pretences. The correspondent to whom we are indebted for the specimens asks, "What is 'Guinea Corn'?" I have wondered whether this could be the same under another name. * * * That was introduced here 60 or 70 years ago."—According to Darlington, the "Guinea Corn" was precisely this "Drooping Sorghum," and not the erect kind. As to whether there is any place in our agriculture for any Sorghum as a grain crop, we much doubt. The clusters, with their great numbers of small grains, have the appearance of being very productive, but we doubt if a given area of this would yield as great a weight of grain as the same in Indian Corn. There is little probability that the grain of Sorghum will ever come into use with us as an article of food, save as a rarity or curiosity. Like rice, it can be prepared for eating without grinding—hence is suited to semi-civilized or barbarous nations. The whole grain is hoiled or roasted, and by some tribes

eaten raw. We are unable to find an analysis of the grain, but feel sure, from its appearance, that it contains a much smaller amount of nutritive principles than wheat or others of our food grain. Indeed the fact that it has not obtained a foothold either in Europe or in this country, though frequently introduced, shows the popular estimate of its value. It was tried in Europe as early as 1596, and has since been introduced on several occasions, as it has been in this country. The late attempts to popularize these grains under such false names as "Pampas Rice" and "Ivory Wheat," are not likely to succeed now any better than they did as "Guinea Corn" and "Indian Millet" with our grandfathers. However valuable they may be to the native negro tribes of Africa, these grains will scarcely be sought after as food in a country where wheat and Indian Corn are so abundant as with us.

DROOPING SORGHUM.—(*Sorghum cernuum*).—"PAMPAS RICE."

What may be said in their favor as forage crops, will be found in our article in February, 1877.

Renovate the Fowl Houses.—I. K. Felch writes: This month should not pass, without the fowl houses being thoroughly white-washed, and the nests made clean and free from lice. The floor should be covered with three or four inches of gravelly loam, that the sun may dry it before cold weather sets in. If the windows are not so arranged that the sunlight may fall directly on the floor, have them changed so that it will; for this sunlight and dry earth will enable you to winter fifty per cent more fowls in the same quarters—by reason of their agency in deodorizing the droppings—than can be kept on a bare floor, or upon the ground, for, in the latter case, the earth will become damp and filthy. Have the flock in winter quarters before the hunter's moon, and begin the feed of meat as soon as frosts cut off the insect supply, also providing green food, as chopped roots, etc.

An Experiment with Pearl Millet.

BY PETER HENDERSON.

Pearl Millet has been cultivated for some years as a forage plant in some of the Southern States, as "African Cane," "Egyptian Millet," "Japan Millet," and in some places as "Horse Millet," but little was known of it at the North before last year, and then only in such small quantities as to hardly allow of a fair trial. From what we saw of it in 1877, we determined to give it a thorough trial this season. A piece of good strong loamy ground was prepared as if for a beet or turnip crop, by manuring with stable-manure at the rate of 10 tons to the acre, plowing 10 inches deep, and thoroughly harrowing. The Millet was then sown in drills 18 inches apart, at the rate of 8 quarts to the acre. We sowed on the 15th of May, about the date that we plant corn; in 12 days the plants were up so that a cultivator could be run between the rows, after which no further culture was necessary, for the growth became so rapid and luxuriant as to crowd down every weed that attempted to get a foothold. The first cutting was made July 1st—45 days after sowing; it was then 7 feet high, covering the whole ground, and the crop, cut 3 inches above the ground, weighed, green, at the rate of 30 tons per acre; this, when dried, gave 6½ tons per acre as hay. After cutting, a second growth started, and was cut August 15th—45 days from time of the first cutting—its height was 9 feet; it weighed this time at the rate of 55 tons to the acre, green, and 8 tons dried. The third crop started as rapidly as the second, but the cool September nights lessened its tropical luxuriance, so that this crop, which was cut on October 1st, only weighed 10 tons green, and 1½ tons dried. The growth was simply enormous, thus: 1st crop in 45 days, gave 30 tons green, or 6½ tons dry. 2d crop in 45 days, gave 55 tons green, or 8 tons dry. 3d crop in 45 days, gave 10 tons green, or 1½ tons dry. The aggregate weight being 95 tons of green fodder in 135 days from date of sowing, and 16 tons when dried to hay. This exceeds the clover meadows of Mid-Lothian, which, when irrigated by the sewerage from the City of Edinburgh, and cut every four weeks, gave an aggregate of 75 tons of green clover per acre. There is little doubt that Pearl Millet is equally as nutritious as corn-fodder, which it resembles even more than it does any of the other Millets. We found that all our horses and cattle ate it greedily, whether green or dry. If sowing in drills is not practicable, it may be sown broadcast, using double the quantity of seed—say 16 quarts per acre. The ground should be smoothed by the harrow, and again lightly harrowed after sowing; if rolled after harrowing, all the

better. I know of no farm crop that will better repay high manuring, but so great is its luxuriance that it will produce a better crop without manure than any other plant I know of. In those parts of the Southern States where hay can not be raised, this is a substitute of the easiest culture, and being of tropical origin, it will luxuriate in their long hot summers; even though our Northern seasons may be too short to mature the seeds, our experiments in New Jersey this summer show what abundant crops may be expected if the similar conditions are secured. Pearl Millet as a fodder-plant presents a new feature in our agriculture, and I feel sure that within ten years we shall wonder how we ever got on without it.—[This plant, *Penicillaria spicata*, was figured in the *American Agriculturist* for January last, where an account of its history will be found. We know that considerable quantities of the seed were disposed of, and we shall be glad of reports from those who have tried it, especially unfavorable ones; these, if the probable causes of failure are given, are always instructive.—Eds.]

A New Hardy Grape—The "Highland."

The history of American grape culture presents nothing so remarkable as the success of Mr. J. H. Ricketts, of Newburg, N. Y., in producing new seedlings. Mr. R. began a number of years ago to raise seedlings from our best native grapes, and also to hybridize our natives with different varieties of the European vine. The result has been astonishing,—indeed we may say embarrassing, for what can be a more unpleasant position than that of Mr. R. who finds himself with—if we mistake not—over 60 varieties, not one of which is too poor to keep, while the world has no place for them all. If ever one was overwhelmed by success it is Mr. Ricketts. Some few of his varieties are already in the hands of the nurserymen, and others, no doubt, will in time find their way into the trade. In former years we have given an account of some of these grapes as examined in Mr. Ricketts' garden, and as they have appeared from the liberal specimens with which we have been favored. It can not be expected that all these new varieties will be suited to general culture, or that they will all behave as well every where as they do on the ground

thing remarkable, and Messrs. H. assert its perfect hardiness in their grounds. Good foliage and free growth we must have in any grape destined to be popular, whatever its fruit may be. We wish grape growing to be more universal than it even now is; people in general will not eodde and care for a vine that is not perfectly hardy and healthy. In all

pulp; the flavor rich and delicious; the skin is without aerid taste, and, while thin, is apparently sufficiently firm to allow of transportation. We shall look with interest upon the future of this grape, and hope it may equal its present promise. We hope that some plan may be devised, by which the choicest of Mr. Ricketts' grapes may be made

A NEW GRAPE—THE "HIGHLAND."

where they originated; were they to do this, it would be even a greater wonder than their general superior quality now is. Still we have every reason to expect that a sufficient proportion will stand the test of general cultivation to add a considerable number of new varieties to our present long list—varieties, too, vastly superior in quality to any we now have in cultivation. Several of Mr. Ricketts' varieties were purchased a few years ago, by Messrs. A. Hance & Son., Red Bank N. J., with the intention of offering them in their catalogue after they had been properly tested. Those who know the caution of Messrs. Hance in respect to new fruits, need not be told that in offering one of these grapes this fall, they have good reason to think it suited to general culture. The only one of the half dozen or more varieties purchased of Mr. Ricketts that they yet offer, is the "Highland." This is a hybrid between the "Concord" and "Jura Museat," and was formerly known in Mr. R.'s collection as No. 12 B., under which number it has in former years been exhibited and commented upon. In foliage and growth of vine it resembles the Concord; one well known grape-grower, in whose hands the Messrs. Hance had placed the "Highland" for trial, recently informed us that its vigor of vine was some-

fied with the testimony as to the "Highland." The bunch and berry are shown of full size in the engraving, which is from a drawing after exact measurement by Mr. T. P. Pope, of Newburgh, an artist well known for his accurate and life-like paintings of fruit. The heavy shouldered bunch is characteristic of the "Highland," and the evenness in the size of the berries is also an excellent feature. The color is black, with a bluish shade, and there is an abundant but delicate bloom; there is no hard

our articles on grape culture we have not advised planting the best varieties we knew of, but the best that will be sure to give them grapes. In respect to health and hardiness, we are well satis-

accessible to cultivators, and at the same time bring him proper remuneration for his labors. They are too fine to be kept in private hands.

Horticultural Absurdities.

The tendency to excess is not peculiarly American; bedding in figures with flowers and colored leaves has been carried so far in England that it is ridiculed as "floral fireworks," and the floral decoration of the dinner table has reached a point where it has called forth vigorous protests from Englishmen who insist that, however it may be with roast-beef and plum-pudding, roast-beef and posies "don't go together." But we need not go to England for examples of horticultural excess—our American tendency to what is expressed in the slang of the day as "running things into the ground," manifests itself in our gardening as well as in other matters. Last year we mentioned Forest Hill Cemetery, near (if not now in) Boston, as affording examples of very neat bedding designs; a visit to the grounds this year shows some of quite an opposite character. The amount of bedding there is

something bewildering, and some of it in excellent taste, but there are some things there that should never be repeated, for they "make the judicious grieve." There is one absurdity, we do not know what it is intended to represent; it is something with a handle, it may be a basket; the handle—a hollow wire frame, probably—is planted with succulents, and on each side are two short pillars, which, if not harrels or casks covered with plants, might as well be, as they look like representations of those articles. It was unpleasant to see this and some other monstrosities in a place where they know how to do better things. The so-called "Floral designs" at exhibitions are as often something to avoid, as they are things to be commended. We have very little sympathy with the fashion that works flowers into broken pillars, anchors, and the like, but as this gratifies many, and affords employment to many others, we do not object, so long as it is kept within bounds. At the last exhibition of the N. Y. Horticultural Society, there were liberal and extra premiums offered for works of this kind, and it brought out some strange designs. There was a pair of shoes on a cushion; the shoes were of white flowers without, and of scarlet flowers within, which looked distressingly like a red flannel lining. But why make shoes out of flowers? Why degrade these delicate creations by working them into the semblance of something that is to be trodden under foot? There were various clocks and mantle pieces, and strange affairs, unlike anything else. There was a camp-fire, with a tripod, and something hanging that might have been a tea-pot, or may have been a tailor's goose. A greater absurdity was a fire-place, with an attempt to represent coals and flames in scarlet flowers. It becomes a question whether a Society is properly educating the public taste by exhibiting such things. Of course they attracted attention, and were admired by certain people; but the persons who are pleased by such absurdities are those who would admire the old topiary work, where bears, and boars, and other horrors were clipped out of box trees. It was a relief to turn from the numerous horticultural absurdities to one or two simple, but exquisitely neat bouquets—not those with a silver fringe, but sufficiently beautiful without—and the most appropriate of all the funeral designs, a plain, heavy wreath of ivy leaves, with a few heads of ripened grain.

An Enemy to Sweet Corn.

Several specimens of sweet corn have been brought us, and others were shown at the late Exhibition of the N. Y. Horticultural Society, with the kernels largely destroyed. At first sight, we supposed it to be the work of the Boll-worm, or Corn-silk worm, which is often found in corn; that, however, enters when small by the way of the silk, and eats as it goes, but in these specimens the attack was made from without, and we were assured that it was the work of a "bug." At last the culprit was caught in the act and brought, when we recognized it as a well known flower-eating beetle, the Indian Cetonia, (*Cetonia Inda*, or *Euryomia Inda* of some). It is of the size shown in the engraving, mostly of a light yellowish brown, with irregular black spots, and has a changeable metallic lustre; it is very hairy, especially below.

This beetle has two broods, one appearing in the spring and the other in September; they usually feed upon flowers, especially those secreting honey, and have been especially known for their depredations upon peaches, in which they sometimes make sad havoc. Authors mention their feeding upon the sweet sap of corn stalks, but do not notice their attacks upon the ear. In some localities, the injury to sweet corn has been considerable this season, but we have not heard of it among field corn. The full history of the beetle does not seem to be well known, but it is supposed that its larva lives in the ground upon roots. Its fondness for sweets, and the fact that the second brood is the only one thus far known to do mischief, suggest that they may be diminished by trapping the first brood by means of some sweet bait, and destroying them.

A First Class Pear, The Ansault.

About the middle of September we received from Messrs. Ellwanger & Barry, of Rochester, specimens of the "*Bonne de Puits d'Ansault*," a pear which, though they have had it on trial for several years, is so little known, that it may be regarded as new. Eight years ago, Mr. Barry, in writing of the newer pears, said of this, "will rank as best, and is really the best in this list." The specimens fully sustain this claim to "rank as best"—indeed we are ready to say that, if not the best pear we ever tasted, it is as good as any. In their recent catalogue, Messrs. E. & B. say "fully equal to the best Seckel," beyond which praise cannot go. This variety was named and sent out by Andre Leroy

THE "ANSAULT" PEAR.

(Angers, France), in 1865; it first fruited with him in 1863, and at Rochester in 1870. Mr. Barry described the tree as a fair grower, with small leaves, bearing young and very productive. The accompanying outline, gives the shape of a specimen of the average size. It is thus described. "Size medium to large; Form roundish obovate; Stem an inch long; Calyx small, deep; Skin a light golden russet, like the 'Golden Beurré of Bilboa'; Flesh melting, fine grained, sweet, juicy, vinous; Quality, best; Season, middle to end of September." This pear bears the name of the locality where the parent tree grew, a name quite as forbidding as *Beurré Gris d'Hiver Nouveau*. It does not seem right that a fruit of such superlative excellence, should start on its career, weighted with such a name, for the reasons that Americans have not time to use such names, and not one in a thousand could pronounce this correctly if he tried.

Freely translated the name means, "The good (pear) of the well of Ansault." We are as great sticklers for accuracy in nomenclature as any, holding it little less than a crime to change the name of a fruit, if it has one. In the present case, we propose to do at the outset, what every one who raises, and every one who buys the fruit will do, if the pear attains the popularity we predict for it, *i. e.*, shorten the name. Popular usage settles that the Duchesse d'Angouleme, shall be Duchess, and

the King of Tompkins County, shall be King among apples, and no earthly power will make people say *Bonne de Puits d'Ansault*, when *Ansault* will answer. We do not propose to change the name, but simply to leave four fifths of it "understood." Even with *Ansault* we foresee trouble; at a fruit-stand just below our office, there was last winter, a sign of "Dan Joe pears," for *Beurré d'Anjou*. When the present excellent variety finds its way into the hands of the street vender, we may expect to see, "Ann Salt Pears" placarded at the stands.

The Refrigerating Fruit-Box.

BY PETER HENDERSON.

A light, portable refrigerator for shipping fruit and vegetables by southern growers to northern markets, has recently been invented by Mr. H. A. Duc, of S. Carolina. It consists of a box of light wood, lined within with galvanized iron, a space being left between the box and lining of an inch or more, which is filled with charcoal or other non-conducting material. The box is provided with one or more shallow movable ice-boxes, made of galvanized iron, provided with handles, and an opening which is closed by a screw-cap. The

boxes are filled with broken ice, and closed so securely that no water from the melted ice can escape and injure the fruit. These ice-boxes are of the same height as the fruit baskets or cups, and may be substituted for a tier of these, allowing one or more to be used according to the requirements of the season, one, at the top, being sufficient in moderately warm weather, and as the season grows hotter, one of the lower tiers of fruit may be replaced by a box. Fruit received in New York from southern points, can by means of these refrigerators be safely re-shipped to Boston or elsewhere; the boxes being replenished with ice, it is ready for another journey. Before giving an opinion of this invention, we visited several of the principal commission dealers in New York, and

found that the representations of the patentee were fully confirmed by those who had tested it; two firms, dealing largely in strawberries, stating that fruit received in this refrigerator brought, on the average, 10 cents more a quart than that shipped in the ordinary manner. An instance was cited of a shipment made from Charleston so late as May 10th, in which the strawberries received in Mr. Duc's refrigerator averaged 23c. per quart, while those carried in the steamer's ice-boxes brought but 12c., the difference being due solely to the superior condition of the former lot.

The cases are made square, or longer than wide; the one shown in the engraving is 23 inches square

H. A. DUC'S REFRIGERATING FRUIT-BOX.

by 19 inches high, and provided with strong handles which shut down flush with the sides; the cover, shown at the rear, is double, and filled in the same manner as the sides; this is fastened down by large screws with square heads, which are countersunk. The ice-boxes, one of which is seen at the right hand, are 4 inches high, of a size to fit the interior of the case; the opening to admit the ice is about 3 inches across; the cap is screwed tight by means of an iron rod, bent as seen in the

engraving; its ends fit into two holes in the cap; when not in use, this handle is removed and laid upon the ice-box. A case holding 72 quarts, when filled and ready for shipment, weighs about 250 lbs. Though Mr. Duc has taken out a patent for the invention, he liberally allows us to say that he will permit any fruit grower to make the box for his own use, without exacting a royalty for his patent.

What Is a Sweet Potato?

BY PROF. ASA GRAY.

We speak of *Potatoes* and *Sweet Potatoes*, as if our common Potato was the real thing and the saccharine subject of this article had got its name from its similarity to the other. The fact is just the other way. *Batatas*, whence the English word *Potatoes*, is a South American native name for the Sweet Potato, which was known to Europeans, and under this name, before anything was known of our tuber. The latter and later known was taken for a sort of *Batatas*; and, being the only one which could be raised as a crop in Northern Europe, it usurped the name of Potato among English-speaking people generally; but here only at the North. At the South, the Potato is a Sweet Potato, and its Peruvian namesake is an Irish or White Potato. This cold-country Potato we all understand to be a *tuber*; and a tuber is a sort of underground stem, or mostly the thickened tip of an underground stem. A slender subterranean shoot thickens at the farther end or tip, for a space that includes several joints with their side buds, or eyes, and this is the Potato.

Now, what is a Sweet Potato? Is it a tuber like its namesake, or is it a root? That the old hotanists called it a root, settles nothing; for they did not distinguish any better than people in general do now. I had always regarded it as a true root. It is described or mentioned as such by French and German hotanists generally; but in some English botanical text books it ranks as a tuber. On the other side of the Atlantic they are not so familiar with Sweet Potatoes as we are. But even here I find that some of our hotanists are puzzled by them.

It is easy to see why. Sweet Potatoes are propagated from shoots which freely spring from the parent potato, and from the sides of it, not from the very top as in a beet and turnip. In these the thick root is formed by direct growth from the seed; and the very top is stem, and so bears a bud, or buds. The Sweet Potato—which we never raise from seed—springs from the lower part of the slip we planted, and from the under side of the branches which trail and creep along the ground. If these Potatoes spring from stems, as common Potatoes do, why are they not of the nature of stem, as common Potatoes are? We planted a little experimental Sweet Potato patch, to settle that question, and dug into it from time to time, to see what was going on. It turns out as I expected. In the underground growth of common Potato plants there are two clearly different things produced, namely: 1. Slender roots, which branch freely and taper at the end into fibres. 2. Slender branches of evidently different appearance as to their surface, ending in the Potato, on which the regular little scales that answer to leaves are visible almost from the first, and the eyes or buds just above them soon appear. In the Sweet Potato plant, all the young growth is of one sort, all are clearly roots; and after a while some of these roots thicken up more or less, and at length the stronger ones become Potatoes. As the summer advances, rootlets strike from the lower side of the creeping stems, at or near the joints, in considerable numbers; these penetrate the soil, and some of these, pre-

cisely like the others, thicken into Potatoes. [The engraving shows a part of the original "set," or cutting, and one of the numerous creeping stems, at the joints of which roots have formed; some of these are beginning to thicken at the end to form potatoes. To save space, the roots are somewhat shorter in proportion than they naturally are.—EDS.] There are all stages here—from slender roots to slender Potatoes. Nothing can be clearer than that these Sweet Potatoes are really roots. That they will produce buds is no argument to the contrary. Hundreds of species of plants may be propagated by root-cuttings. These buds appear near the upper end of some of my Sweet Potatoes, while they are still young or small; and in some they are starting into shoots.

THE SWEET POTATO.

But none of them start from the axils of little scales, and they are without order. They are like the buds on the roots of Osage Orange, Blackberry, etc., by which these plants are freely propagated by root-cuttings. It is clear to me that a Sweet Potato is a true root, but one that has a happy proclivity to produce adventitious buds, which immemorial propagation in this way has confirmed.

Ivy—Begin Now.—When we see a window furnished with the most beautiful of all screens, a living one of Ivy, or a room in which the vine is made to run upon cornices or surround the picture frames, if we do not envy the possessor, we feel a strong wish that we had something like it. Recollect that all this luxuriance had a beginning; this vine, the total length of which measures yards, was once but a few inches long. A small cutting, a little care, and time. These were all the outlay required for this treasure of verdure—and all these are within the reach of every one. Time, indeed, is the chief element, but after a fair start has been made, less is required than one would suppose. Make a beginning; if with a rooted plant, all the better; if only a cutting or "slip" can be had, start with that, for it will take root with the greatest ease. When growing, give it a fairly rich soil; water as needed, and—especially this—remove the dust from the leaves as often as it accumulates, by the use of a sponge and warm water, and in time the reward will come,

THE HOUSEHOLD.

BY FAITH ROCHESTER.

Does it Pay to Make Rag Carpets?

To make or not to make a rag carpet—that is the question. I have rags enough to carpet another room, and I need another every-day carpet. When I see the bags and boxes where the old cleansed garments and pieces fit for a rag carpet are packed away, the impulse seizes me to go to work and get them converted into a plain serviceable carpet.

It seems for a moment that this course must be true economy. But is it? I have made one carpet within a year. There it is again—"I made it." Mother cut and sewed nine-tenths of the rags, and I let her do it—for which I hope to be forgiven. For when it came to weaving, the warp and weaving cost me thirty cents a yard, and I had an opportunity a few months before to buy an entirely new rag carpet quite as good as mine for fifty cents a yard, and other strong cheap carpeting can be bought for the same price. That leaves twenty cents a yard for cutting and sewing the rags, to say nothing of the rags themselves, which are worth something for paper rags, and a few for dealing with the "second-hand man." Twenty cents a yard for cutting and sewing the rags! And it takes from a pound to a pound and a half of the rags to make a yard of carpeting, and it would be a hard day's work to sew two pounds of rags so short as mine averaged, made largely of children's clothing and other old garments. It did not pay my mother and me, and when we handed the rags over to the weaver we felt that we had been doing a foolish thing. With a sigh of relief, mother turned from the rags to the regular sewing, which she had been wishing to help about, and as she mended and repaired, and made button-holes, and did the necessary hand-sewing on garments mostly made by machine, I felt how much more than twenty or thirty cents a day was her help, and what a hateful

thing my rag carpet would always be to me. Like many another mother with children grown up and full of the cares of children and housekeeping, mother wishes to help her children when she visits them, but she shall never sew carpet rags again.

But now I have hired help. As some excuse for getting her—for I was afraid that what I knew to be exhaustion might look like laziness to others—I said, "and while she stays we will make the rest of my rags into another carpet." But there is plenty else to occupy our time, in the way of sewing as well as housework. And I want my girl to have some time for her own, every day—not only time to make her own clothes, but time for some evening game. No, her time is too precious for carpet rags. Well, here are the children. Two little girls old enough to handle a needle, and a boy who could (with some difficulty!) be dragooned into the business. They all have a few regular chores each day—enough to make them feel that they are helping to bear the family burdens, and I honestly think that these are enough at present, with the lessons they have at school and at home. For I believe heartily in *play*, both out-doors and in, and I want to leave room for it and to encourage it as a legitimate thing. The thirty cents a yard which I should pay for warp and weaving (I might possibly get it for less now), would buy me a good carpet of straw matting, and if I should count in the time spent in cutting and sewing, and the value of the rags, I could get a more expensive carpet

for the rag carpet proposed. Suppose I get the matting, sell the cotton rags to the tin peddler, and make a few good plain rugs (pieced and braided ones, for I have no time for the pulled or drawn rugs), to lay over it in places where most warmth is needed in winter, or where most wear will come. Would not that be the best economy? I think it would, if we take into account the happiness and health and mental growth of the whole family—and if I had time I could show you how they are all involved in the question as to how we shall spend our time and money. Still I am not prepared to vote absolutely against all rag carpets. A good carpet of this kind will do a great deal of service—much more than almost any cheap carpet of the same money cost. The most reasonable method seems to be, to cut up the old garments and sew and wind them in balls as soon as they are unfit for other service, disposing at once of the refuse as paper rags. A housekeeper who has leisure, as childless housekeepers often have, or one who has children able and willing to help, can do this. Only good rags will probably be used, and some day there will be a carpet all ready to weave. Some housekeepers really do have time to make rag carpets, and to read good books, and to take walks with their children, and to keep up a correspondence with their absent friends, and social visits with their neighbors. Each housekeeper and mother must judge how she can best spend her time.

Banged Hair.

I am glad that this horrible fashion has such a horrible name. It is a fashion that disgraces our sex. Its prevalence shows that a great proportion of womankind are willing to submit to almost any indignity—even to having "idiot" written plainly on their faces—if it is only "the fashion." I have pitied little children so disfigured, and when I have met grown-up women and girls seriously appearing with banged hair in public places, in apparent ignorance of their disgrace, I have felt that I ought to, as Whittier says in "Ichabod,"—

"Walk backward with averted face
And hide the shame."

It seemed unkind to look such deluded "females" full in the face, for fear they might think you noticed their deformity or idiotic appearance. I don't know whether the word "banged" applies to the short frizzes worn over the forehead, but I have supposed that it only meant the short hair hanging straight down over the forehead like a fringe, not at all in an "artless" manner, but in a style so defiant of all artistic sense, as to stamp its inventor as absolutely ignorant in respect to beauty's laws. Woman's dress is a standing joke in the newspapers and among plain-thinking men. They always have some hold by which they can show us up to ridicule. But men are now crying out in agony over the "banged" hair, begging to know *why* women will do so. What possible reason can they have for making their faces hideous to behold?—There is no reason, except that it is "the fashion." I think I have heard, however, that all the frizzing and crimping of the last dozen years has so broken and ruined the forelocks of most young women that they resort to cutting them short in order to strengthen the roots and make these locks grow smooth and fair again. But didn't they know all the time, that frizzing and crimping would break and ruin the hair? Why can't they fasten back this fringe, or shingle the whole head, not too short, and give themselves a respite from all the tediousness of puffs and crimps, and rats and twists, and hair-pins and backcombs, and every other device invented to torture woman's hair?

No, "Simon says 'thumbs up,'" and all the thumbs go up. "Simon says 'wig-wag,'" and all the thumbs wig-wag. "It is the fashion," and we "must" do thus and so. "It is not the fashion," and we must not venture to follow our sense of decency and good taste. That ends it, of course, for the class of women who wear their hair "banged." But my heart relents. There are smart amiable girls, and intelligent young women in the ranks of the "banged." Doubtless they have reasons that I know not of for their tasteless method of dressing the hair.

Making Comforters, or Comfortables.

A comforter for a wide bed should have three and a half breadths, calico width, for the covering of each side, or for the whole, seven breadths, each two and three-eighths yards in length. In purchasing calico, allow sixteen and five-eighths yards. Many fill their comforters with from six to even eight pounds of cotton, but I do not like to put in over five pounds, and it is convenient to have a few light ones with only three pounds of cotton.

Lay the lining of the comforter upon the floor, and spread the cotton evenly upon it, leaving it a little thinner at the edges and corners if you choose, where the comforter will tuck in at the sides and foot of the bed. Open the rolls of cotton carefully, and unfold them as much as possible, making an even thin layer all over at first, and covering this with three, four, or five other layers. All this pulling apart and laying lightly together makes a lighter, softer, and warmer comforter than if the cotton is put in only partly unfolded. Place on the upper covering evenly, and tack all together around the edges. Lift it carefully, rolling it up if necessary, and lay it over a lounge or bed, or large table, beside which you can sit to tie it. Tie at intervals of six or seven inches, tying in tufts of worsted, or sewing through with light-colored yarn, and simply tying this with rather short ends. Turn in the edges of the upper and lower covers, and run them together when the tying is done. This is better than to bind it, as it can be more easily taken apart for cleansing. This method of tying comforters without putting them in frames is a great improvement on the old plan, I think; for the putting it upon the quilting-frame, and rolling and taking it off, was always the worst part of the job.

Mixing Bread without Salt.

Most bread-makers put salt in with the flour, yeast, water, or milk, with which they mix their bread sponge. I see no advantage in it, and I am very sure that the bread is less *sweet* (and to my own taste less delicious) on account of the salt. I have known several persons, who at first thought otherwise, to be convinced of this by experiment.

Christmas Decorations.

It may be thought early to call attention to the subject of Christmas decorations. If we had in mind only home decorations, perhaps it would be; but for Churches and Sabbath Schools it is none too soon. The days of those of our forefathers, who in their protest against formalism of all kinds, neglected all observance of church festivals and holidays, have passed. Their descendants will not be debarred a participation in the festivities of Christmas, and there is scarcely a denomination that does not observe the day in some manner, while the ancient custom of decorating churches, is becoming more general yearly. So many are interested in the matter of Christmas decoration for both the home and the church, that we are sure that a few hints on the subject will be generally welcome. The matter properly comes in the household department, for with the few exceptions of wealthy societies, where the matter is left to the sexton to employ professional decorators, it may be accepted as a rule, that if the church is to be decorated, it will be done by the women of the congregation. We will go still further, and say, that while the women may decorate the church, it will be practically done by one woman, who will be prime mover, head designer, the one who will look after everything; and though she may have help, will be looked to for everything. That one, too, is likely to be the one who reads this article, for it is just such women as *our* sisterhood of housekeepers that are found in the lead in such matters. It is astonishing how one leader will inspire others in work like this; a company of other women will be ready to help, if they are only told what to do; the young women will make it the occasion of a frolic, and will make fun of the work; and the young women being there, the young men—but we are getting away from our subject. Leaving to another time some hints on home decoration, let us consider that of the church, as it will take some

time to bring matters about. In the first place, there must be the decision to decorate at all. There will probably be one of two objections made; it will either be said that the church is too nice and new, and that decorating will injure or disfigure it, or that the church is too old and poor, or too rude and primitive, and decorations will be out of place. Either objection admits of a ready answer. In decorating, we use green leaves, flowers, and fruits, all Nature's, or God's, handiwork, and there is no human structure so perfect, that these will not

Fig. 1.—A STAR.

bring to it an added beauty, while all needed decoration can be done without driving a nail. This suggests the answer to the other objection; if our church is so mean, let us on this occasion cover its poverty. The occasion we celebrate took place in a manger, let us for once glorify our harn of a church. Having decided to decorate, the next question will be how much? This, and all other details, had better be left to the women who read the *American Agriculturist*. We will suggest to those to whom the matter is quite new, not to undertake too much. Have a definite plan of what is to be done, and let it include only what can be done well. If only the pulpit can be well decorated, be content with that; but usually, the whole chancel, or end of the church where the pulpit stands, by whatever name it may be called, as the part towards which all the congregation look, may be adorned. The rest will depend upon the architecture of the church; galleries, pillars, window-frames, heavy cornices, etc., offer opportunities that one with proper taste will take advantage of.

About the Materials.

The kind of green to be used, will of course depend upon the locality, some places affording a greater variety of evergreens than others. Hemlock is one of the most generally useful greens for both large and small work; did it last longer, we would place it as the best, if but one could be had;

Fig. 2.—CIRCLE AND TRIANGLE.

but its leaves soon drop, and become littery. Arborvitæ, Spruces, Laurel, Ink-berry, Holly, and Rhododendron, among the trees and shrubs are the most available; the Lycopodiums, especially the kind known as "Bouquet-Green," or "Ground Pine," are most useful for small work. Those named, are all wild; where materials can be spared from cultivation, Golden and other Arborvitæ, Box, Ivy, and other evergreens, may, by judicious trimming, afford a goodly amount of useful material, and the plants be none the worse for it.

Flowers and Berries.

Those who have been fortunate enough to dry a lot of everlasting flowers, will find them come into play, and berries are especially useful. A few scarlet ones will give a wonderfully fine effect. The most abundant berries for this purpose, are those of

the Winter-berry, or Black Alder, and those who live where Holly grows, will not fail to secure the berries of that. It will be proper to make the pulpit or desk, the center or most prominent point of the decorations, placing the most elaborate work there, and making the rest subordinate to that. The most generally useful decorations are wreaths, as they may be employed in a variety of ways; they may entwine pillars, surround arches and window-frames, and used in festoons anywhere. Next to wreaths, circles, or garlands; and then come in various ornamental designs more or less elaborate.

To Make a Wreath.

A cord or rope, according to the size of the wreath, is required, some small but strong twine, and the green broken into bits, large or small, as may be needed, as the wreath is to be thick or slender. In a division of labor, some will prepare the material, while others make it up. Hemlock, Aborvitæ, Box, or Ground Pine, is to be broken into bits of the needed size, the last named, being often used whole; a loop is made in the rope or cord, by which it may be hung to some convenient door-knob nail, or other support; a piece of the green is laid upon the rope and tied fast with the twine, which, for convenience, should be in small balls, or better wound upon a stick as boys wind a kite string. Another piece of green is laid on to lap over the first, and made fast with a simple loop of the twine, or what the sailors call a "half-hitch." The work is continued in this manner, each bit overlapping the tied end of the one before it, and each fastened with a loop. The size of the wreath is governed by the size of the twigs and the manner of lapping; in every case, the work should be even and alike. When the wreath is of the proper length, fasten the last pieces by several turns of the twine, and tying it very securely.

To Make Garlands and Stars.

Split a barrel hoop, or whittle it down, or form circles of willow wands or whatever shoots will answer, and make them fast by tying the ends with twine, or what is better, fine copper wire. The frame-work being made, it is to be covered in the same manner as the green is fastened to the cord to make a wreath. A star may often be used with good effect, alternating with garlands, or by itself. These are easily made with two triangles of common lath placed across one another as shown in figure 1, they may be made narrow and covered in the manner already described. If large leaves, like those of Holly, Ivy etc., are to be used, the star may be made of stiff, brown paper, and the leaves sewed to it with black or green thread; this may then be stiffened by tacking it to a lath frame.

Ornamental Designs

can be made in great variety and as elaborate as one chooses. A simple design is shown in fig. 2; a triangle within a circle. To make this, get a circular board—a barrel head having the pieces fastened together with battens will answer; cover this neatly with white, crimson, scarlet, or blue cloth. Make the circle and triangle of willow with small twigs bound on, to cover one side only, or use large leaves, sewed to shapes of stiff, brown paper or thin paste-board; these may then be attached to the circular base by means of nails. The large design, fig. 3, is intended for the front of the pulpit or desk, or similar place. It consists of a Maltese Cross, a circle, within this a star, and inside of the star the accepted monogram to represent the name of The Saviour, I. H. S. (*Jesus Hominum Salvator*), as used in church decorations. The cross and star are best made of some thin wood; the circle may be of stiff paste-board; the cross and star are covered with white or colored cloth; paper may be used, but the effect is not so rich; the edgings to the cross, star, and the circle, are made with Holly, Ivy, or other leaves sewed to stiff paper shapes, and afterwards tacked on; the monogram, if used, may be made of card-board,

and covered with gilt or silvered paper. We give in fig. 4 another form of monogram, which may be easily constructed from the hints already given. Where berries or dried flowers are to be used on any of these designs, the fine iron wire known at the hardware stores as "binding wire," or a still finer kind, kept by dealers in florist's requisites, as bouquet wire, will be useful; it is very strong, and so fine as to be invisible at a little distance.

Household Notes and Queries.

BANGED HAIR.—We are glad that Faith Rochester records her protest against a fashion which, as with other styles, is new in her far Western home, while in Eastern cities it has run its course and is on its decline. There may be some of our readers, we trust there are many, who have never seen or

Fig. 3. DESIGN FOR PULPIT.

We were dining at the house of a well known gentleman, where the surroundings indicated culture and travel; after we were seated at the table, two young ladies of the family took seats on the opposite side, both having their hair thus disfigured. Never having heard of such a style, the suddenness of its appearance in such a place, its incongruity with the general appearance, dress, and position of the wearers, made it a surprise as unpleasant as it was sudden. When we saw the first young lady, the thought came that the hair had been so treated to hide a horrid scar, but the appearance of the other disposed of this idea. Anything more out of place, more unaccountable than this whim we have never seen. We once lived in a town where there was a family noted for its number of uninteresting children. Their circumstances did not allow of the employment of a barber, but when the hair of the children became too long, the mother cut it in the most impartial manner, straight around, front and rear alike. Their appearance was so peculiar that a waggish friend of ours used to say that Mrs. B. put a bowl over the children's heads as a guide, and cut even with the edge of the bowl. We never see a case of "banging" but we think of the numerous young B.'s with their hair cut round by the bowl.

Fig. 4.—MONOGRAM.

HOW TO MAKE SCRAPPLE.—Last spring some of our house-keeper's circle asked for a recipe for "serapple"; knowing that the best way to get the recipe was to ask here for it, we did so in May last. Our answers came just at the beginning of hot weather, a time when they would be of no use, so we put them aside until cooler weather would bring the materials for making it. Over 20 answers came, and while we thank all who responded, we publish only two of the most unlike:

THE ILLINOIS METHOD WITH SCRAPPLE.—Mrs. H. T. F., Lee Co., Ill., sends the following. "Soak a hog's head, cleaned, and cut up into four or five pieces, in cold water over night, to remove blood; boil till the flesh falls from the bones, and can be easily made fine without chopping. The water should be about three gallons for a whole head, and should be kept up to that amount by adding more while boiling. Let stand until cool, take off and save the fat that rises, to use in frying. Warm it over the fire again, remove the bones, separate the meat into fine particles, without chopping; put the meat, with the liquor, back over the fire, and when boiling, stir in equal parts of Indian meal and buckwheat flour, to make a mush of the ordinary consistence; season well with salt, pepper, and sage; when done, pour into pans, to cool and keep until wanted. When used, slice and fry as you do cold hasty-pudding, using the fat previously taken off; fry to a nice brown on both sides, and serve. In cool weather it will keep for weeks.... It would not be right if we did not give a recipe for

"SCRAPPLE" FROM PENNSYLVANIA, as we have always understood that it originated among the Dutch settlers of that State. The following comes from "W. C. B.," Media, Pa., who says that recipes have appeared in some papers, with hardly a true feature in them. "W. C. B." (who insists that the true spelling is "serappel") says: "In Pennsylvania almost every one who raises hogs makes serappel, and those who do not, obtain a supply from the butchers, who make it in vast quantities. Headcheese is very little used here now, and serappel has to a great extent superseded sausage, as it costs but half as much, and is considered more wholesome. The upper part of the pig's head is used, divested of the snout, eyes, and ears. After soaking some hours in salt water, it is boiled, together with all the trimmings from the hams and shoulders, and the skins from the portions intended for lard. Boil until the whole is very tender, and the bones may be readily separated. A portion, but not generally the whole of the liver, is boiled tender, with the rest, when it is taken out, and crumbled up finely. The fat is skimmed from the top, and the meat, skins, liver, etc., are chopped with a sausage cutter. The whole is then returned to the boiler with a liberal supply of water, and when it boils, it is thickened with Indian meal alone, or a part buckwheat meal or wheat middlings. These are added gradually, as in making mush, with constant stirring. While the mixing is going on, the seasoning is added; usually salt, pepper, and sage. When it is so thickened, as to be stirred with difficulty, it is poured into tin pans or earthen basins to cool. It may be eaten without further cooking, but it is generally cut, like mush, in slices, and fried. Lard settles upon the top of each pan of serappel, so that no other fat is required in cooking it."

Over-Doing It.—Aunt Mchitabel thus sensibly writes from Penn Yan, N. Y.: "There is a good deal of sense and true taste in Faith Rochester's remarks on house decoration in the September number of the *American Agriculturist*; little touches here and there do brighten up a room, and make it more cheerful and home-like, but the truth is, that ladies who have a taste for fancy-work are apt to over-decorate their rooms until they too much resemble one that my sister saw last year in an interior town, and which she described to me as 'mottled, and bracketed, and wall-poeketed, and dried-grassed to death!' Certainly the owner of that room did not believe with Michael Angelo, that 'the strictly beautiful is the very purgation of superfluities.'"—There can be too much of a good thing.

BOYS & GIRLS' COLUMNS.

Spruce-wood Work.

In suggesting last month that you should lay in an abundance of stores with which to make little useful and fancy articles for presents or other purposes, we mentioned spruce twigs as a material from which a variety of very pretty things might be made. For making little picture frames, pen-racks, and such articles, small twigs are needed, but for the work we are about to describe, those from the size of a lead-pencil up to that of the finger will be better. We have seen very neat boxes made in imitation of a pile of logs that would not be very difficult for a boy who is careful in the use of tools. Figure 1 shows how these boxes look when finished; you can un-

Fig. 1.—SPRUCE-WOOD LOG-PILE BOX.

derstand from the engraving how to manage all but the front and rear of the box, which represents the ends of the logs. To make this, some of the larger twigs are carefully split in halves and quarters, to be used with the whole ones and fit in among them. Here we may say, that if the leaves do not fall off of themselves, they may be readily removed by laying the twig upon a flat board, and scraping them in the direction of the leaves—from below upward, with a strong knife. Having the twigs, lay several of them side by side, using care to select those that will lie flat and touch one another for their whole length; then put strong glue on the parts where they touch and glue them together; when these are dry, pile a layer upon the first, gluing them to the twigs below, and to one another, letting the glue dry or "set;" add another layer, and so on until as many are put together as desired. If the gluing has been well done, you will have a solid block of twigs; when all is dry and firm, with a fine saw cut slices across the end of the block, as thin as may be required; these will need careful handling, but if they hold together until used, it is all that is needed. These are to be glued to the front and rear of the box, matching the sections to make a fit and if need be, putting in some bits sawed from single twigs to fill spaces. The engraving shows the rest; the ends are covered with split twigs,

each end, to appear like a brace to hold up the log-pile. Where there is sufficient surface, glue is all that will be needed to fasten the twigs to the box or to one another, but in some cases, as the handle, or the top row of logs, it will be better to use, besides the glue, slender brads, or strong pins with their heads cut off. The box should be lined according to the purpose for which it is to be used, fancy paper or tin-foil may be put on with paste. This being the general manner of working, various other articles besides boxes, may be covered with the twigs; we give some engravings to serve as hints, and your own ingenuity will no doubt suggest others. In figure 2 is a match safe, made like an old fashioned tankard; the body of this is a toy churn, to which the split twigs are glued, the lid is covered with the end pieces, with an acorn or a pine cone as a knob; the bands or hoops, and handle, are made of grape vine; a piece of sand-paper should be glued on the underside of the lid. The flower vase, fig. 3, is made from a glass or china vase of the desired shape. In the first place, the whole outside of the vase should be covered with muslin, put on with a thick paste of gum tragacanth; when thoroughly dry, the split twigs are glued to this; the handles are made by soaking the twigs in hot water until they bend easily, and bending them around pegs set in a board at proper distances, and tying them to hold them in position; when dry they will retain their shape; the edge of the vase in the engraving is finished with a row of the tips of spruce twigs where there will be found a bud at the very end, usually having two others under it. The napkin ring, fig. 4, may be made with a wooden napkin ring, or one may be made of

very stiff paste-board, lined according to fancy, and then covered with split twigs, cut very even, and neatly matched at the edges. In fig. 5 we have a design which may be filled and covered for a pin-cushion; if lined with tin-foil it

Fig. 4.—NAPKIN RING.

will answer as an ash receiver, or if made large enough, and given a cover, will do for a puff box. All of these articles may be ornamented, if desired, by gluing bits of lichen, spruce buds, acorn caps, and such things, here and there. Other wood besides spruce may be used, especially that which has a pleasing bark; it should be seasoned by keeping it in a place where it will dry slowly.

GLUE for this and other fancy work should be strong, and put on hot; very little will be required, and there should never be enough to run. To make it, get the best cabinet maker's glue, cover it with cold water, and leave it in a cool place to soak; in a few hours it will be swelled up and soaked through, as will be known by its being soft and bending easily; pour off all the water, and place it on the stove, set in a sauce-pan or other vessel of water; as soon as melted and hot it will be ready for use. When cold it will become hard, but may be melted again by placing the vessel in hot water—it must never be put directly upon the stove, but always in a sauce-pan of water. A tin pepper or spice box will answer for the glue, and a fruit can will do to hold the water. Work of this kind looks better if finished with one or more coats of

SHELLAC VARNISH, which is better for this purpose than ordinary varnish; it may be had at the paint stores, or you can make it yourself by putting shellac into a wide-mouth bottle, and adding alcohol enough to cover the shellac; set this in a quite warm place, or in a sauce-pan of cold water, putting in some sticks or wires to keep the bottle from touching the bottom of the pan; place on the stove and heat gradually. The shellac will soon dissolve, and if too thick to apply smoothly, thin with more alcohol. Be careful not to work with this near a lamp, and remember that not only will alcohol burn, but that its vapor will take fire.

Hoorah for Crandall!—We have long considered Mr. C. M. CRANDALL as the greatest friend of the Little Folks in all this country, if not in any other

country. Millions have been amused, delighted, and instructed, too, by his building blocks and various other contrivances. Even the children of staid old London, in England, have sent over here for many tens of thousands of Crandall's blocks, etc., and they have come for

Fig. 3.—FLOWER VASE.

them from other parts of Europe, even from Germany, the land of toy-makers. Well, just now, Mr. Crandall has beaten himself again, more completely than ever before, too. His new "**Happy Family**," which none of you have seen yet, beats not only himself, but even Barnum, also, because you can each have a "happy family" right at home. You get a box, looking like a wagon-box at first; but it opens and opens, and before you get through with it, you have a menagerie on wheels—a wagon big enough and strong enough almost for a small boy to ride on—a cage of 15 animals and their keeper, Lions, Tigers, Chimpanzee, Rhinoceros, Bear, Baboon, etc., behind bars, looking as natural as life, with movable legs, etc. They are so arranged that you can combine them a thousand ways. When tired of arranging, training, and exhibiting the animals, you can set them aside and use the wagon. Everybody who has seen this, says it is the greatest thing in the way of amusement for children that has yet been brought out. They have started the factory running night and day, so as to get as many sets made as they can this month, in order that as many children as possible may be supplied before the next holidays. Probably the advertising pages will tell you something about it. A gentleman took the first sample box to show to a friend in London, and as soon as he got there, the Ocean telegraph said: "Send the first 25 cases (300 sets) made, over here."

Fine Things for Boys and Girls.

EASILY OBTAINED FREE.

In arranging their Presentation Articles, or Premiums, the Publishers have provided a large number of things

Fig. 5.—ASH RECEIVER.

that will specially delight their Younger Readers. They offer them on such terms, that almost any Boy or Girl of 8 to 14 years, or any older young people of 15 and upwards, can easily get free one or more very desirable articles. Any one can show this paper, and persuade two, or three, or more persons to subscribe for it, in return for which they will get something that they just want. We like the young people to all take hold of this for two reasons. First: they will be pleased in receiving the premi-

Fig. 2.—MATCH SAFE.

and the top with a layer of split twigs, over which is a row of whole ones; a crooked piece may be put on for a handle, and if desired, an upright twig in the center of

ums; and, second, they will learn business, very useful to learn early in life. The Senior Publisher of this paper took his first useful lesson in publishing by canvassing for a club of subscribers, while a student. For many years we have noticed that boys and girls are often more successful than older persons, when they go and show a paper, tell what it contains, and its usefulness, and ask a man to take it. Let every one of our young readers examine the Premium Sheet, see what is offered, select what they most want, and determine to get subscribers enough to obtain it free, and then persistently stick to it, until they succeed. If the first dozen persons asked refuse, try them again, and go to the thirteenth, and fourteenth person, and so on. What you determine to do, you can do.

The Young Microscopist's Club.

In telling you about what are called the lower orders of plants—such as bear no regular flowers and seeds—I began with those that are regarded as the highest among such plants; that is, those which have distinct and complete parts, and most nearly resemble in these respects the flowering plants. Thus, the ferns have a root, a stem, and green leaf-like fronds; the mosses have roots, stems, and leaves. Both ferns and mosses have also a regular place for bearing their spore cases. When we came to the lichens, this distinctness of parts was lost; in the flat lichens there is merely the upper and under surface of an irregular flat plate, and the spore-cases, or fruit-dots, are placed irregularly on the surface.

WE NOW COME TO THE FUNGI,

the plural of Fungus; it is pronounced with a soft g, as if spelled *Funji*. The Fungi are still less like ordinary

Fig. 1.—COMMON MUSHROOM.

plants. In the ferns and mosses, we find roots and green leaves, and have reason to infer that, like higher plants, they live upon the nourishment they draw from the soil and the air, and the lichens mainly live upon the air and what the rains bring them. The fungi are very different in their manner of living; they feed upon the substance on which they grow; it may be living or dead vegetable or animal substances—but they are always robbers or scavengers, feeding upon food already prepared for them. This being the case, the fungi never have leaves or other green parts, and most of them, if they do not prefer darkness, can live as well in the dark as in the light. The family of fungi is so large, and it contains plants so unlike, that it is difficult to make a simple description that will include them all. There are fungi so small that it takes a powerful microscope to see them, while the puff-ball is often a foot across, and some fungi are larger than this. The fungi you are most likely to notice are those large and showy kinds called

MUSHROOMS AND TOADSTOOLS.

The eatable mushroom, common in the fall of the year in pastures, will serve to illustrate this set of fungi. As you find it, it appears as shown in fig. 1, but this is only the above ground portion, and is what in these plants corresponds to the fruit. There is below the surface, a mass of fine, white threads, commonly called the "spawn," and which botanists call the *mycelium* (from the Greek word for mushroom); this is the growing part of the plant, so to speak, and answers to the roots and stems of other plants. This spawn feeds upon the matter it finds underground, and when strong enough, it throws up the parts that are to provide

Fig. 2.—CLUSTER CUP ON LEAF.

for new plants, the parts that produce the spores. On the under side of the cap of the mushroom, you find thin plates running from the center to the edge, and if you had a very powerful microscope, you could see that the spores were produced by these plates. But the greater number of the fungi, and the most important in the mischief they do, are so small, that they are only to be seen by the naked eye when in a mass, and to make them out properly requires a much more powerful microscope than ours. The most common of these small fungi are the moulds we find so common on vegetable and animal substances, on stale bread, on cheese, on decaying fruit, and in numberless other places. I had occasion last month to speak of mould found on a correspondent's boots; that figure, here given (fig. 4), gives a general

idea of the manner of growth of these fungi; it consists of the most minute threads, which grow and spread rapidly; these are the *mycelium*; after a while some threads will shoot upwards from this and bear spores at the top. All of the mildews, the smuts, the rusts, and other pests of the farmer and fruit-grower, are minute fungi of one form and another, which live upon the grain, the grass, the leaves of the fruit trees and vines, and the fruit itself. A vast number live upon wild plants that are not known to do any damage, but which you will find very interesting when examined by your microscope. Among the prettiest and most noticeable of these

Fig. 3.—CLUSTER CUP.

ARE THE CLUSTER-CUPS, so called, as they appear as little cups in clusters upon the leaves and stems of various plants. One of the largest of these I ever saw, was on a pear leaf, and is shown in fig. 2. These have a growing portion, or *mycelium*, that lives in the substance of the leaf, and the cluster-cup is what answers to the fruiting part. In fig. 2, the leaf was brown and dead in spots, showing where the *mycelium* had been feeding and had killed it. The magnified cluster-cup is shown in fig. 3; it has around the edge, a little fringe, which spreads in moist weather and curls up in a dry time; within the cup are the spores, which you know serve the same purpose that seeds do in other plants, i. e., to produce new plants. You will find cluster-cups on a great number of wild plants; sometimes so thick that they run together, and when old, form a shapeless mass. When you find cluster-

cups—and they will be oftener on the under than on the upper surface of the leaf—you can readily preserve them by drying the leaf between the pages of a book, and make a note of the kind of leaf on which it grows. Some of the cluster-cups are of a pretty orange color, while others are brownish. Wherever you find an unusual appearance upon a leaf, it will be well to examine it with your microscope, as you may find some fungus that will be worth looking at. You will find them at almost all seasons of the year, and hunting for these, mosses and other such plants, may be kept up long after other plants are killed by the frost. You all know that some fungi are used as food, and that others are poisonous, and no doubt several of you will write to ask how to tell them apart. Indeed, one of your number, Miss Annie J., of Knoxville, Tenn., put the same question several months ago; my answer was put in type, but it failed to find room in the paper then, and I give it here. Her question was—"How can I

TELL A MUSHROOM FROM A TOADSTOOL?"

and she probably could not give a more difficult one. What is generally called "The Mushroom," is *Agaricus campestris* of botanists; it (fig. 1) is the best known, and the one that is often cultivated. In the popular idea, all others are "toadstools," and to be regarded with suspicion. Instead of there being but one fungus that may be eaten, the late Rev. M. A. Curtis, of South Carolina, found over a hundred different kinds, some forty of which grew near his home, and which he ate regularly. Miss Annie's question means, "how can I tell between a wholesome fungus (or mushroom) that should be eaten, and a poisonous one (or toadstool) that should be avoided."

—This is a question which I can not answer. If I were to ask Annie to so describe her most intimate friend, so that I should be sure to know her at once, if I met her on the street in Knoxville, she would find it very difficult to do so—though were I to be introduced to her friend, and see her but for a minute, I should know her at once afterwards. Here is just the trouble with these fungi. It is not possible to describe them in popular language, so that one who has never seen them can be sure that he has a safe one, but if she can see, examine, smell, and

taste, she will be sure to know it, when she sees it again. Now, unless Miss Annie can get some friend who knows, to point out the eatable ones, I do not think I can help her. All the directions to test them with rubbing silver or putting salt upon them, are useless.

Aunt Sue's Puzzle-Box.

NUMERICAL ENIGMA.

I am composed of 23 letters:

- My 22, 19, 14, 19, 7, 19, 17, is a kind of cloud.
- My 4, 8, 18, 12, 19, 16, is another kind of cloud.
- My 3, 10, 13, is what farmers are busy with in July.
- My 5, 6, 7, 9, is part of my whole.
- My 1, 21, 13, is happiness.
- My 20, 2, 22, 23, is a protection.
- My 16, 15, 11, is a number.
- My whole is a story and its author. LOUISA J. SPEED.

CROSS-WORD.

My first is in satin but not in silk,
My next is in cheese but not in milk,
My third is in made but not in wrought,
My fourth is in mind but not in thought,
My fifth is in brass but not in tin,
My sixth is in crime but not in sin,
My seventh is in churl but not in thief,
My eighth is in bush but not in leaf,
My ninth is in onion but not in leek,
My tenth is in look but not in seek,
My eleventh is in man but not in boy,
My twelfth is in glee but not in joy,
My thirteenth is in smile but not in laugh,
My fourteenth is in some but not in half,
And now if you make my letters agree,
A character in Dickens you will see.

CHARADE.

My first steals forth as night descends,
And prowls around in search of food,
And many longing wishes sends,
T'wards old dame Partlett and her brood.
My second, in the good old time
Was gift of love, and battle gage,
The theme of many a tuneful rhyme
By Poet, Troubadour, and Page.
My whole adorns where'er it grow,
In garden, field, or leafy dell;
In skillful hands 'twill health bestow,
Though death lurks in each tiny cell. C. K. S.

About Aunt Sue.—Aunt Sue has for a long time felt that the large correspondence that grew out of the answers to puzzles, required more time than she could spare, and finding her home cares increase—for she has grand-children who have demands upon her time—she can not take the entire care of the Puzzle Box. She will, however, contribute to it when she can; but hereafter the answers to puzzles and all matters that were formerly sent to Aunt Sue, may be directed to "The Doctor," No. 245 Broadway, New York.

About Some Common Birds.

It is pleasing to learn that so many of our young friends take so much interest in birds. We know this by the questions that come to us about them; only a few days ago a youngster in far off Washington Territory wrote us concerning birds. Besides the pleasure that comes from observing and studying any natural objects,

Fig. 1.—BOBOLINK IN SUMMER.

the interest of young people in birds will lead to one important result. In watching the different birds you will notice what kinds of food they live upon, and when you find that most of the small birds feed their young upon insects, especially the caterpillars that are so destructive to plants, and see the wonderful number of these that a nestful of young birds need in the course of a day, you will see that the birds are really useful, and will encourage them rather than drive away or destroy them. Chas.

H. M., Maryland, has been told that the Reed-bird is the same as the Bobolink, and wishes to know if it is so. The difference between the summer and winter dress of birds has puzzled others besides Master Charles, and even experienced naturalists have been deceived and taken the winter state of a well known bird for another species. The change in the Bobolink is not confined to its dress, but in changing its coat it changes its manners or habits. The two engravings show, as well as can be done in black and white, the bird in its two suits, that at the left-hand being the summer, and the other the winter plumage. The Bobolink as it comes to the Northern States in spring is well known to every one who lives in the country; the male has a very neat suit of black and cream-colored and whitish markings, while the female with her dress of yellowish brown, with some black streaks, does not look at all like the mate of so gay a fellow. What youngster, boy or girl, does not know the Bobolink? With its lively ways and merry song it seems to be the happiest of all birds, and as fond of a frolic as a

school boy. Many have tried to put his song into words, imagining that his sweet notes have some resemblance to our harsh language. One of these is, "See little Joe, see little Joe, kissing Judy, kissing Judy, Oh fie!" and there are others, all over the country. When summer is about over, and the young brood is raised, the male Bobolink stops all his frolicking, takes on a sober dress like that of his mate, and so changed is he that he even

stops singing; instead of being full of life and fun, he seems to care for nothing but eating. It soon starts on its journey southward, and great flocks are found on the marshes of the Middle States, and as they get further South they visit the rice fields in immense numbers, and are there called the Rice-bird or Rice Bunting. The poor bird becomes a real glutton, but it eats only that it may be eaten, for it is shot down by thousands to supply the demand of the markets. Those who would not think of eating a Bobolink, find the Reed-bird or Rice-bird a delicious morsel. In its travel southward it even finds its way to the West Indies; it arrives there from our Southern rice-fields so fat that it is known as the "Butter-bird." While the majority of our birds, like the Bobolink, leave for warmer lands at the first approach of cooler weather, others, like faithful friends, stay with us summer and winter, and though while other birds are abundant we do not much notice these, they are in the winter very welcome, as they come about our houses, and give life to the landscape. One of the best known of these winter birds is the Black-cap Titmouse, or as it is more commonly called, the Chickadee, a name taken from its note. Very neat little birds they are—marked, as seen in the lower engraving, with a black head and throat in strong contrast with the white of the breast and

under parts, while the back and upper parts are grayish brown. They are too busy in summer with their brood to care much for our company, but as other birds leave, and cold weather comes on, they draw nearer and nearer to the house, and if encouraged will become regular in their visits and afford much amusement by their pretty ways. One peculiarity of the Chickadee, is, that it does not seem to care much whether its head is up or not, and in alighting it is quite as likely to point head downwards

If you wish to make friends with the winter birds, have a regular place to put their food; if a window shelf or the roof of a piazza be chosen, do not forget to brush away the snow; feed crumbs, seeds, and broken grain regularly, and they will soon learn to come at the time. The Chickadee is not much of a singer, its note being confined to *Chiveek-a-dee-dee-dee*, but it gives it in a pleasant and cheerful voice. It makes its nest in small hollows in

Fig. 2.—BOBOLINK IN AUTUMN.

a tree; taking the old hole of a Wood-pecker, or if it finds a partly decayed place it makes a hole, being careful to carry off the chips and drop them at a distance, as if afraid that they might lead to a discovery of the nest. It raises quite a large brood, from 6 to 10 eggs being laid, and of course such a family consumes an immense number of insects; it is estimated that each pair of these birds eat at least 500 insects daily through the breeding season. Besides these, the old birds in winter are very

sharp at finding the eggs of insects and cocoons that are hidden under the loose bark and in other crevices. The Chickadee has so many good qualities that we dislike to say anything bad about it, but it has been accused of a very mischievous habit—that of picking off and destroying the buds of fruit and other trees. On the other hand it is said that the bird only pecks at those buds that already contain a grub of some kind, that it is the insect that it is after; and that what seems like mischief on the part of the bird, is really a good act, as it prevents the insect from doing further damage. We hope that this may prove true—at any rate here is a good chance for some of you sharp-eyed boys to observe; if you find the Chickadees busy among the

Fig. 3.—CHICKADEE, OR BLACK-CAPPED TITMOUSE.

as in any other way, and they seem to be fond of all sorts of gymnastic tricks, turning over and under a twig as if they were exercising on a trapeze. These, as well as the other birds that stay with us during the winter, fare poorly when the ground is covered with deep snow, and are then especially in need of the food you may give them.

fruit trees, watch their doings, and if any buds are picked off, examine these for traces of a grub or caterpillar, and let us know the result. We shall be sorry to learn that the little friend who does so much to make the country pleasant in winter, destroys the buds of fruit trees without any object, but through pure mischief.

FOR WINTER & SPRING

B. K. BLISS & SONS' CHOICE COLLECTIONS. HYACINTHS, CROCUS, TULIPS, LILIES, NARCISSUS, &c.

Our beautifully illustrated Catalogue of the above, with full directions for culture, to which is added a list of *Small Fruits—Winter Flowering Plants* for house culture, *Agricultural Seeds and Garden Requisites*—72 pages, will be mailed to all applicants sending 10 cents. Regular customers supplied gratis.

AGENTS LOOK! Catalogue of 44 Novelties free, or, with a Hand-hook invaluable to letter writers, ten cents. T. J. HASTINGS & CO., Worcester, Mass.

What Shall We Read?

A monthly magazine has become almost indispensable to every one who desires to read the writings of the best contemporary authors, and to be informed of the most important events in literature, science, and art. More and better reading, and handsomer illustrations, can be supplied at far less cost in this form than in any other. For instance, the numbers of SCRIBNER'S MONTHLY for one year contain almost *two thousand* large octavo pages, filled with essays, stories, poems, descriptive articles, and reviews by the first American and foreign authors, and illustrated with more than six hundred original wood engravings. When bound, the twelve numbers make two large, handsome volumes which contain more matter than a dozen of the ordinary subscription books, and which can take their place on the library shelves as permanent records of the best literature of the year.

Attractions of Recent Volumes.

This is especially true of SCRIBNER'S MONTHLY during the year just closed, the two volumes XV and XVI, being more rich in pictorial interest than any which have preceded them. The first of these volumes has as frontispiece a PORTRAIT OF ABRAHAM LINCOLN, drawn from a rare photograph by Wyatt Eaton and engraved by T. Cole; the frontispiece of the second is a PORTRAIT OF WILLIAM CULLEN BRYANT (from life), by the same artist and engraver. The two volumes contain the whole of Edward Eggleston's "Roxey," the concluding chapters of Adeline Trafton's "His Inheritance," and the beginning of H. H. Boyesen's "FALCONBERG;" the exquisitely illustrated papers, by Mr. Brewer, on BIRD ARCHITECTURE; articles on American Sports, profusely illustrated, including "Canvas-Back and Terrapin," "Deer-Hunting on the Ausable," "Fox-Hunting in New England," "Moose-Hunting in Canada;" papers on American Farm Life, illustrated by some of the leading artists of the country; Maurice Thompson on Archery; Mary Hallock Foote's Descriptions of California, illustrated by herself; Col. Geo. B. Waring on Horses; John Burroughs on Birds and Out-Door Life; W. M. Tileston on Dogs; Dr. Morton on the South African Gold Mines; Stories by Bret Harte, Saxe Holm, Rebecca Harding Davis, Henry James, Jr., Frank R. Stockton, George P. Lathrop; Poems by R. H. Stoddard, E. C. Stedman, Bret Harte, H. H. Boyesen, H. H. Celia Thaxter, J. T. Trowbridge, etc.

Special Arrangements for 1878-9.

"Haworth's," by Frances Hodgson Burnett, the author of "That Lass O'Lowrie's" will be the leading serial of SCRIBNER for 1878-9. It is the longest story Mrs. Burnett has written, and will be more profusely illustrated than any serial which has yet appeared in the magazine. Mr. Boyesen's "Falconberg" will run through a part of the year; to be followed by a serial from a new writer, Mr. George W. Cable, of New Orleans. His novel will exhibit the state of society in Creole Louisiana, about the years 1803-4-5, the time of the Cession, and a period bearing remarkable likeness to the present Reconstruction period. The series of portraits of American poets will be continued during the coming year, the next being that of Longfellow (in November). These portraits are drawn from life by Wyatt Eaton, and engraved by T. Cole. They will appear as frontispieces of four different numbers, during the magazine year. The magazine is now having prepared several articles on the leading Universities of Europe. They will be written by an American College Professor—Mr. H. H. Boyesen, of Cornell (author of "Falconberg," etc.)—and will include sketches of the leading men in each of the most important Universities of Great Britain and the Continent.

Among the illustrated papers in preparation are "Studies in the Sierras," by John Muir, the California naturalist. The series of eight or more papers now to appear will sketch the California Passes, Lakes, Meadows, Wind-Storms, and Forests, including the first description ever given of the coniferous trees of the Sierras. Mr. Herbert H. Smith, of Cornell University, a companion of the late Prof. Hart, is

now in Brazil, with Mr. J. Wells Champney (the artist who accompanied Mr. Edward King in his tour through "The Great South"), preparing a series of papers on the present condition,—the cities, rivers, and general resources of the great empire of South America. The "Johnny Reb" Papers, by an "ex-Confederate" soldier, will doubtless be among the raciest contributions during the coming year. They are written and illustrated by Mr. Allen C. Redwood, of Baltimore. Illustrated contributions are also announced on Canada, American Art and Artists, American Archæology, American Inventors, Lawn-Planting for Small Places; also, Essays by Prof. Sumner, Horace White, and others, on the National Banking System, the Patent System, the New South, etc., etc.

The Latest Number.

We desire to call especial attention to the November number of SCRIBNER'S MONTHLY, upon the preparation of which great care and expense have been bestowed. We shall print as a first edition 90,000 copies. The number will contain the opening chapter of "Haworth's," and the continuation of Mr. H. H. Boyesen's "Falconberg." A biographical paper on Longfellow, with a large frontispiece portrait by Wyatt Eaton, engraved by Cole; "A Night with Edison," the fullest and most authentic account yet published; "Johnny Reb at Play," the first of several non-partisan papers of life in the ex-Confederate Army; "Farm-Life in New York," by John Burroughs; "The Spelling Bee at Angel's," by Bret Harte; "Fort Chamblay, on the Richelieu River," by Henry Sandham; "A Wind-Storm in the Forests of the Yuba," as observed from a tree-top, by John Muir; "A Modern Playwright (Eugène Scribe);" "The Apparition of Jo Murch," and "Our Patent System, and what we Owe to it," by an expert; "Parsons and Parsons," by Edward Eggleston, etc., etc. For terms, see paragraph "How to Subscribe," at foot of the page.

What Do Our Children Read.

The reading, which, unknown to parents, finds its way into the hands of their children, is often of the very worst kind. It is stated that there are twenty-five pernicious story papers for boys and girls, published in New York City, alone, and their popularity is shown by the fact that these vicious sheets have a circulation of over 375,000. They are printed on cheap, poor paper, are widely advertised, and are offered for sale at prices which enable even the poorest children to obtain them. Prof. W. G. Sumner, of Yale College, speaking of the effect of this literature upon the young, says:

"We may generalize the following, in regard to the views of life which these stories inculcate, and the code of morals which they teach:

The "Dime Novel" Code.

"The first thing which a boy ought to acquire, is physical strength for fighting purposes. The supposed code of English brutality prevails, but it is always mixed with the code of the revolver, and in many of the stories, the latter is taught in its fullness. These youngsters generally carry revolvers, and use them at their good discretion.

"A boy ought to cheat the penterious father who does not give him as much money as he finds necessary, and ought to compel him to pay. A good way to force him to pay liberally, and at the same time to stop criticising his son's habits, is to find out his own vices (he always has some), and then to levy black-mail on him.

"As to drinking, the bar-room code is taught. "Quiet home life is stupid and unmanly. Boys brought up in it, have to work hard and to bow down to false doctrines which parsons and teachers, in league with parents, have invented against boys. To become a true man, a boy must break with respectability and join the vagabonds and the swell mob.

"No fine, young fellow, who knows life, need mind the law, still less the police. If a father is rich, the son can easily find smart lawyers who can get him out of prison, and will dine with him at Delmonico's afterward.

"It is impossible that so much corruption should be afloat and not exert some influence. Great harm is done to boys by the nervous excitement of reading harrowing and sensational stories. Parents and Teachers ought to know what the character of this literature is."

An Ideal Children's Magazine.

It was to counteract this poisonous element in children's literature, that Messrs. SCRIBNER & Co., in 1873, began the publication of St. NICHOLAS, an Illustrated Magazine for girls and boys, with Mrs. Mary Mapes Dodge as Editor. Five years have passed since the first number was issued, and the magazine has won a position second to none. It has a monthly circulation of over 50,000 copies. It is published simultaneously in London and New York, and the transatlantic recognition is almost as general and hearty as the American. Although the progress of the magazine has been a steady advance, it has not reached its editor's ideas of best, because her ideal continually outruns it, and the magazine as swiftly follows after. Today, St. NICHOLAS stands alone in the world of books; and in Europe, as local critics admit, there is no magazine for young people that can at all compare with it. It is not surprising that the New York Tribune said of it: "St. NICHOLAS has reached a higher platform, and commands for its service wider resources in art and letters than any of its predecessors or contemporaries;" or that the London Literary World has said: "There is no magazine for the young that can be said to equal this choice production of Scribner's press."

Good Things for 1878-9.

Mr. Frank R. Stockton's new serial story for boys, "A Jolly Fellowship," will run through the twelve monthly parts—beginning with the number for November, 1878, the first of the volume—and will be illustrated by James E. Kelly. The scene of this story, like that of the very successful one, "What Might Have Been Expected," published in St. NICHOLAS, is laid in the South. For the girls, a continued tale, called "Half-a-dozen Housekeepers," by Katharine D. Smith, with illustrations by Frederick Dielman, will begin in the same number; and a fresh serial by Susan Coolidge, entitled "Eyebright," with plenty of pictures, will be commenced early in the volume. There will also be a continued fairy-tale called "Rumpty Dudget's Tower," written by Julian Hawthorne, and illustrated by Alfred Fredericks. About the other familiar features of St. NICHOLAS, the editor preserves a good-humored silence, content, perhaps, to let her five volumes already issued, prophesy concerning the sixth, in respect to short stories, pictures, poems, humor, sketches, etc., etc.

The November Number.

Attention is especially invited to the November number now ready. It contains 72 pages, and its illustrations throughout are fine and varied. It begins two splendid serials:—Its shorter papers represent a wide range of subject—History, Travel, Fun, Poetry, Adventure, Science, Natural History, Home-life, Sport, and lively narrative—the whole crowned by an appropriate Thanksgiving story.

One long article and two poems bear the signature of Mary Mapes Dodge, the Editor. One very "taking" feature of the number, is a fine portrait of FRANK R. STOCKTON, accompanied by a sketch of his life. Then there is a beautiful poem by Lucy Larcom; a finely illustrated account of the new style of city railroad in San Francisco, and many other good things.

How To Subscribe.

These magazines are for sale by all Booksellers, Newsdealers, or Post-Masters, or they will be sent by us at following prices. SCRIBNER'S MONTHLY, \$4.00 a year, 35 cts. a number. St. NICHOLAS, \$3.00 a year, 25 cts. a number. Persons wishing to subscribe direct with the publishers, should write name, Post-Office, County, and State, in full, and send with remittance to SCRIBNER & Co., 743 Broadway, New York. All readers of this advertisement, not now subscribers, may, upon sending their subscriptions, deduct 10 cents to pay cost of check, P. O. Order, or Registered letter, and Send \$3.90 for SCRIBNER'S MONTHLY, or \$2.90 for St. NICHOLAS. We will send, as a specimen, a copy of SCRIBNER'S MONTHLY for February, 1878, for 15 cts., or St. NICHOLAS for Dec., 1877, for 10 cts., or both for 25 cts., which amount may be deducted if a yearly subscription is afterward sent.

SCRIBNER & Co., 743 Broadway, New York.

50 Richly perfumed Cards, no 2 alike, name in jet, 10c.; with Case, 13c. 25 Murphy Temperance Cards, 20c.

F. W. AUSTIN & CO., North Haven, Ct.

A beautiful JAPANESE HANDKERCHIEF, equal in finish to the finest silk. **FREE** for Stamp.
W. HILL & CO., Ashland, Mass.

SAFETY, COMFORT, ECONOMY!

THE RUBBER CUSHIONED AXLE

reduces breaking, jarring, jolting, vibration, and noise to a minimum, thereby assuring greater safety and comfort in riding, with a large saving in wear and tear. It also saves horse power by lessening traction, and therefore is of special value to **SULKIES and ROAD WAGONS.** It will improve the riding and wearing qualities of any vehicle, whether **LIGHT or HEAVY**, however good its construction or easy its springs.

CORRESPONDENCE INVITED.

THE RUBBER CUSHIONED AXLE CO., Broadway and 43d St. (Long Acre), New York.

TO FARMERS.

Their Sons and Daughters

Who wish to make money this fall and winter. We can give you Employment, honorable, pleasant, and remunerative; at home or abroad. Send for information to

American Publishing Company, Hartford, Ct.
or, 118 Randolph St., Chicago, Ill.

This book needs no Endorsement.—**DR. PALMER.**

AGENTS WANTED FOR DR. MARCH'S NEW BOOK, **DARK**

In this new volume the Popular Author of **NIGHT SCENES** in the Bible portrays with vivid and thrilling force and eloquence the events of Sacred Truth, and adds fresh testimony to the beauty, pathos and sublimity of the Scriptures of the Bible. Agents will find this Book with its sparkling thoughts, glowing style, beautiful Engravings, and rich bindings, the best in the market. **Terms Liberal. Circulars Free.**
Address, **J. C. MCCURDY & CO., Phila., Pa.**

PALLISER'S MODEL HOMES. NEW EDITION.

100 pages, 6x9, 30 plates, 20 Designs for Model Cottages, Farm and Country Houses, also Farm Barn and Henner, Stable and Carriage House, School House, Bank and Library, Masonic Ass'n Building, Town Hall and 3 Churches, descriptive specifications, hints on building and a large amount of miscellaneous matter, making a very valuable book for every one intending to build. Price \$1, post-paid. Address the publishers,
PALLISER, PALLISER & CO.,
ARCHITECTS, BRIDGEPORT, CONN.

Scribner's Lumber & Log-Book.

OVER HALF A MILLION SOLD. Most complete book of its kind ever published. Gives measurement of all kinds of lumber, logs, and plank, by Doyle's Rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cordwood tables, interest, etc. Standard Book throughout United States and Canada.

Ask your bookseller for it, or one sent by me for 35 cents, post-paid.

G. W. FISHER,
P. O. Box 238, Rochester, N. Y.

FRIENDS! If you are in any way interested in

BEE OR HONEY,

We will with pleasure send you a sample copy of our **MONTHLY GLEANINGS IN BEE CULTURE**, with a descriptive price-list of the latest improvements in Hives, Honey Extractors, Artificial Combs, Section Honey Boxes, all books and Journals, and everything pertaining to Bee Culture. *Nothing Patented.* Simply send your address on a postal card, written plainly, to
A. I. ROOT, Medina, Ohio.

STEEL PENS, SOLD BY ALL DEALERS.

No. 91 JOHN ST., NEW YORK.

HENRY HOE, Sole Agent. JOSEPH GILLOTT & SONS.

GAME BIRDS, THEIR HABITS, HAUNTS and HOW TO SHOOT THEM.

By **THOMAS ALEXANDER**, author "Fish and Fishing" &c. New shooting costume; a new method of learning how to shoot "on the wing," with improved Sight for the purpose; upland shooting; wild fowl shooting; new decoys, to swim, fly and dive; boats, stands, new Portable Blind; training the dog; the Rifle and its use, with new sights, &c. Over 50 illustrations. The best book on the subject. Price, post paid, only 20 cents. Sold by all Newsdealers, or address **Donnelley, Gassette & Loyd, The Lakeside Library, Chicago.** Catalogue free.

25 of the Prettiest Cards you ever saw, or 18 Elegant New Style Chromo Cards, with name 10 cts., post-paid.

GEO. I REED & CO., Nassau, N. Y.

25 Styles of CARDS, 10c., 18 Best CHROMOS, 10c., with name. Outfit 10c.

J. B. HUSTED, Nassau, N. Y.

A 32-column monthly Story Paper one year **FREE** with 50 Gold Leaf Cards, with name, in FREE Gem case, 25 cts. **Eagle Printing Co., Springfield, Mass.**

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from p. 408.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

Husk or Hoose in Calves.—**G. Silleck.** An emaciated condition, accompanied with a cough, indicates the presence of parasitic worms in the throat of the calf. The disease is akin to the gapes in chickens and verminous bronchitis in lambs. The proper treatment is to give a table-spoonful of turpentine in a pint of milk, daily, for two days, to be repeated a week later. To cause the calves to breathe the much diluted fumes of burning sulphur, or the fine powder of dry-slaked caustic lime in the air of a close stable, is also recommended.

To Keep Milk Cans from Rusting.—"Silleck." The more tin cans are scoured the more they will rust, as the thin coating of tin is thus worn off, and the iron under it exposed. To prevent rusting, paint outside with Asphalt varnish or some mineral paint.

Cerebro-Spinal Fever.—"O. T. R.," Montgomery Co., Kas. The symptoms of Epizootic Spinal Fever are: loss of appetite, with dullness and drooping head, followed by trembling and unsteadiness, caused by partial paralysis, and finally, inability to rise when down. The disease is frequently fatal. The treatment so varies according to the symptoms and the violence of the attack, that no general directions can be given. There being no gall bladder in the horse or mule, its absence is no sign of disease. Spinal fever shows itself on post mortem examination in changes in the spinal marrow, its covering membrane, and of the brain.

Parasitic Skin Disease.—"J. M. E.," South America, Ill. The skin of the horse is sometimes infested with one or more parasitic insects, the effect of which is to cause loss of hair, thickening of the cuticle, irritation and accumulation of crusts which sometimes break and discharge. The remedy is to wash the skin with warm soap-suds, break up the crusts, and apply thoroughly with a brush a mixture of 1 lb. each of soap and alcohol, and half a pound each of pine tar and sulphur. A mixture of 20 oz. of whale oil, and 1 ounce of carbolic acid, is fatal to the parasites; but is it sometimes injurious to the horse as well.

Scarifier for an Old Meadow.—"R.," Richmond, Va. An effective scarifier to break up a tough, "bound out" sod, would be one of the revolving disc harrows. If the sod is hard to penetrate, the harrow may be loaded with stone, and drawn by four horses.

How to Feed a Calf.—"W. G. H.," Rock Co., Wis. The following method has proved satisfactory to the writer: Let it suck for five days; then separate it from the cow and teach it to drink. Give it one quart of fresh milk at each milking time, and a quart of warmed sweet milk at intervals of three hours. After a week of this, gradually increase the supply until at a month old it is getting 8 quarts a day. After the calf is two months old it may have 10 quarts a day in four meals; and between these half a pint of dry mixed bran and oats, finely ground. The meal may be gradually increased to a pint a day. A little cut hay mixed with the meal may be given at four months old; then some corn-meal may be added.

Sheep Peeling Trees.—"A. H. D.," St. Louis Co., Mo. To preserve trees from being barked by sheep, wash them with a mixture of cow dung and clay or clayey loam; soot will increase its "keep off" qualities.

Pea Fowls and Guinea Pigs.—"T. W. S.," Spencer, Mass. A pair of pea fowls will cost from \$10 to \$30, according to the quality. Their eggs are usually hatched under a turkey. Guinea pigs are pretty pets, but of no practical use. A dry box is the best pen for them.

Deerfoot Farm, Southboro, Mass., is becoming one of the famous farms of the country. Deerfoot Farm pork is an esteemed delicacy on many hotel and private tables, and its 10,000 lbs. of butter finds a ready sale at high prices. How success has been obtained in these specialties, Mr. Edward Burnett, the proprietor, proposes to let the farmers learn for themselves, by holding a "Field Day" on Nov. 6th (previously announced for Oct. 25th), to which farmers generally are invited. After an inspection of the farm, the Town Hall will be thrown open to visitors, and opportunity given for a discussion of the things observed, under the auspices of the Southboro Farmers' Club. Such "Field Days" combine the features of a fair and farmers' club, and doubtless each one of the large number who will accept the invitation will receive a full return for the time and expense.

32-Rowed Corn is inquired for by several of our readers. Those having it for sale, should advertise it.

The International Dairy Fair, in N. Y. City, commencing Dec. 2d, at the American Institute, (instead of at Gilmore's Garden, as previously announced,) is being organized rapidly, and promises to be a real success. Subscriptions to the fund for expenses and premiums are being received in encouraging amounts from merchants, transportation companies, etc., and firms and private individuals are offering large special prizes, some of which were announced last month. The latest is a "sweepstakes premium," offered by H. K. & F. B. Thurber & Co. of New York, "of \$250 for the best package of butter (not less than 50 lbs.) salted with Higgins' Enreka Salt. This is open for competition to any farmer, dairyman, or creamery in the United States."

Waste of Manure.—"J. G." Adams Co., Pa. "Barn-yard manure spread on the surface and exposed for eight or ten days before plowing under," must lose somewhat in value, as decomposition is very rapid under the influence of air and moisture, which will result in the formation and exhalation of ammonia. Cold weather checks decomposition, but there will be more or less of it going on in the manure at any time when not frozen. If mixed with earth by plowing or harrowing in, or kept in heaps covered with earth, there is no risk of loss.

Kids.—In answer to "W. H.," Mr. "L. M. R.," of Orrville, Ala., writes that kids are born in pairs, sometimes three at a birth. He owns "a goat not yet two years old that is mother and grandmother of eight, seven now living. The increase of goats is more than double that of sheep. Goats are taxed in Alabama as a nuisance."

Lombardy Poplars for Lightning-rods.—Professor Asa Gray sends us the following note: The reason which lies at the bottom of the general belief, on the Continent of Europe, that lightning strikes the Lombardy poplar trees in preference to others, is coming to light. Green herbage, and green wood—sappy wood—are excellent conductors of electricity. A tree is shattered by lightning only when the discharge reaches the naked trunk or naked branches, which are poorer conductors. An old-fashioned Lombardy poplar, by its height, by its complete covering of twigs and small branches, and their foliage, down almost to the ground, and by its sappy wood, makes a capital lightning-rod, and a cheap one. Happily no one can patent it, and bring it round in a wagon, and insist upon trying it on. To make it surer, the tree should stand in moist ground, or near water; for wet ground is a good conductor, and dry soil a poor one. It is recommended to plant a Lombardy Poplar near the house, and another close to the barn. If the ground is dry, the nearer the well the better—except for the nuisance of the roots that will get into it.

The Best "Cure" for Choked Cattle is an "ounce of prevention" in the shape of a root-cutter, through which all roots, apples, etc., shall be run before being fed to the animals. The price of such a machine is much less than the value of a single cow. Many farmers have lost several animals from choking during the years which a good root cutter would last.

Italy's Agricultural Products.—The Statistical Volume issued by the Minister of the Interior this year, gives the following figures: Population, 28,030,030. Acres of Wheat, 10,000,000; product, 136,000,000 bushels. Corn, 4,000,000 acres; product, 80,000,000 bushels. In Grapes, 4,000,000 acres; Wine produced, 27,000,000 hectolitres (713,286,000 gallons); Olives, 2,000,000 acres; Olive Oil produced, 3,300,000 hectolitres (\$7,179,400 gallons). Silk grown, about 4,500,000 lbs.; but so much rough silk is imported and manufactured that Italy exports over 5,000,000 lbs. of manufactured silk. About 20,000,000 lbs. of Wool are grown, and about 15,000,000 lbs. imported to manufacture, employing over fifty thousand persons. Flax and Hemp are largely grown, and manufactured by the poorer women everywhere. Military conscription absorbs about 100,000 able-bodied

young men every year, each of whom serves three years in the regular Army; then on leave of absence 5 years; then gives partial service in the reserves 4 years, and in the Militia 7 years—in other words, is liable to be in or called into active service at any time during 19 years. Thus 500,000 men are constantly in the regular Army—quite a deduction from the number of producers, as compared with our own country, where less than 25,000 men are in regular military service, or one to twenty as compared with Italy. In some other European countries, the proportion is much larger than it is in Italy.

Milk in Sealed Glass Jars, after the "Arcy Farm" method, described on page 413, has been sold in New York for some time. The price is 20 cents per quart jar, and as it insures just as pure milk as the cow can give; the plan suits wealthy customers very well, while it is said to be quite remunerative to the farm supplying it. The glass jars, or any nice packages, not only are an assurance of the purity of the contents, but when such pains are taken in the marketing, the buyer may be reasonably sure of good feed, proper care, and neatness at the farm. Such efforts always pay, under proper management in production and marketing.

White Fuchsias.—"H. P.," Ionia, Mich. There are varieties of Fuchsia with white calyx and colored corolla, and *vice versa*, but we do not recollect to have seen any that were quite white throughout.

Loss of Cow's Tail.—"J. B. A.," Providence, R. I. Cows lose the end of their tails from accidents, such as other cows stepping upon them when lying in the stalls, bites of dogs, gangrene, caused by purulent disease resulting from the poisoning of injured parts by filth. There is no remedy for the loss; the switch never grows again, and the tail remains a "stump tail" through life.

Beware!!—Stock Speculation.—We are constantly receiving letters from subscribers, far and near, especially the far off ones, inquiring if this, that, or the other "banking house" or "stock dealer," or "broker" is reliable; if such or such a scheme is not worth a little trial, etc. We say most emphatically, let all stock speculators severely alone. If you have money for which you have no fitter use, present or future, and which you must throw away in gambling, or some other foolish manner, you may turn it to the acquisition of useful, though unsatisfactory experience, by sending it to some winsome, smooth-talking, unknown, irresponsible operator in stocks for others, to be invested (if not pocketed) in "puts," "calls," "options," "straddles," "double privileges," "combinations," etc., etc. It is very easy to put on paper brilliant schemes, demonstrating very positively that you can't lose, but must win. Now and then, not often, an investor is allowed to make a small "strike," just as a bait to others, or to have a brilliant example to refer to. Half a million or more circulars are sent out at a time to as many individuals, informing each one that he is the one selected for such an example. They are sent by shrewd writers possessing the knack of making others believe that they have special advantages for securing "points" in stock operations, the advantage of which they will be most happy to share with others (for a small commission!). Of course they are too rich, or too generous, to want to enjoy themselves all the benefit of their superior facilities for knowing what stock will rise, and what will fall.—A regular Stock Board is useful for the selling and purchasing of good stocks and bonds, as investments, and there are reputable, long-established firms who buy and sell on commission. But there are also numerous "bucket-shops," and irresponsible "bankers" and "brokers" where the chief capital is "assurance," and the ability to write advertisements and circulars of a taking character. So much for the present. If necessary, we will hereafter give a chapter of details on the way things are done in Wall street, Broad street, Exchange street, etc. In the meantime, to any reader who must invest a dollar or two, or a hundred of them in N. Y. stock speculation of any kind, we say, better put it into some organized, honest lottery (if you can find one); or into a horse race, or boat race, where you are sure the horse or boat that ought to win, and is expected to win, is not privately "sold out" after the bets are made (if you can find such an one!).

A New Rotation.—"F. J. G." In any rotation that would be an improvement upon the usual one, a root crop should have a place, and an extra clover crop, or two, if possible. Thus, beginning with wheat seeded to grass and clover, we may take one year, hay; one year, pasture; then corn, followed by roots—mangels preferred; then oats with clover; then clover-hay, and the aftermath plowed down for wheat, which brings us to the beginning again. This would make a seven years' rotation. The two cultivated crops with the clover would clean and enrich the land, and there would be more fodder grown to the acre than in two of our present four year rotations.

Nuts and Nubbins.

Josh Billings says that he goes to the White Hills by the best route in the world, and catches the best-route in the world after he gets there.

A young mother gives her child a stick of candy, and, to teach it politeness, says: "What do children say when they get candy?"—"More!"

A little Florida boy tamed an alligator, and the ngly reptile learned to like the little fellow—not, however, until the little fellow was all gone.

"Fine nainsook, embroidered, makes lovely little slips for children," says a fashion writer. Orange peel on a sidewalk continues to be good enough for men.

"Say, papa, did mamma ever believe that some folks would be lost?"—"Yes, she did," replied the father. "Then what did she suppose would become of you?"

The same backache which makes a boy howl when he's digging potatoes, causes him to smile when he slips off the back way to the picnic. Boys are curious insects.

"We all knows," said a cockney school-committeeman to a teacher he was examining, "that A, B, and C, is vowels; but what we wants to know is, vy they is so."

At a Parisian hotel during the Exposition:—Maddened Guest—"Sixteen francs for a candle!"—Courteous Host—"No, sir; one franc for the candle; fifteen francs for the candlestick, milord."

"What is the national air of this country?" asked a foreigner in Washington. "That's the national air," replied a native, pointing to the Capitol, "but the animals are all out in the jungle just now, chasing voters."

Tourist (to fair companion)—How quiet and lovely! Surely this might be a spot the poet had in mind when he said, "Silence reigns." Guide—Ah, and ye may say that same; and thunders, too, yer honor.

We met a farmer, a day or two ago, who was so hard pushed that he was on his way to pawn his hoe. We told him we were sorry to see his case so hopeless.—"Hopeless!" he exclaimed, "far from it! You know the old motto, 'hoe-pawn, hope ever!'"

Annie—"Can you tell me, ma, why the perfume on the handkerchief of my dear Augustus is like me shooting an arrow at a target?"—Ma—"No, my dear, I don't see the similarity; why is it?"—Annie—"Because it's aro, ma, scent from my beau." Ma faints.

Said Brown to Parker: "I say, Parker, what's the difference between a ripe watermelon and a decayed head of cabbage?"—"Give it up; can't tell."—Brown laughed softly as he said, "You'd be a nice man to send to buy a watermelon, you would!"

When little Thomas stoops to toy with herries, jam, and jelly cake, no art can soothe the chastened boy—no nostrums ease his stomach ache. And if the gripping pains defy the medicines prescribed to foil, his parents will do well to try the limpid, liquid castor oil.

"What is a junction, nurse?" asked a seven-year-old fairy the other day of an elderly lady who stood at her side on a railway platform. "A junction, my dear," answered the nurse, with the air of a very superior person, indeed, "why, it's a place where two roads separate."

The young man had been giving his views about everything to everybody for an unendurable half-hour, when the old man said, with nice courtesy, "I beg your pardon, sir, but if you begin teaching everybody at eighteen, when do you intend to begin learning?"

A mature lady was making herself conspicuous at the opera by talking loudly to two young men accompanying her.—"What a bad example that woman is giving her sons," said in a stage whisper a spectator in an adjoining box. No further disturbance from that source.

A recent advertisement contains the following: "If the gentleman who keeps the shoe store with a red head will return the umbrella of a young lady with whalebone ribs and an iron handle to the slate-roofed grocer's shop, he will hear of something to his advantage, as the same is the gift of a deceased mother now no more with the name engraved upon it."

"A wasps' nest contains fifteen thousand cells," and the greatest of these "cells" is to sit down on the nest under the mistaken impression that all the wasps have gone to the seaside or somewhere on a visit. A single wasp loafing in the back kitchen, will give the sinner a warm reception. And no doubt a married one would treat him in the same manner.

A young lady recently inquired at a store in New York for "Louis Quinze" shoes. Some were shown her by a spruce clerk, but, not liking a peculiarity about the heels, she asked if they had none without it. "Oh, no," said the clerk, "Mr. Quinze always makes them just like this."—"Mr. Who?"—"Mr. Quinze—Louis Quinze—of Parée—he makes all our goods of this class—we have them direct from him. You can see his trademark!" The customer survived to tell the story.

Handy to Have is "Wyckoff's Combination Rule," which unites a variety of conveniences in one small implement. It is at once a ruler and a rule, has graduated arcs for drawing angles, makes circles with great accuracy, and may be readily converted into a balance for weighing letters; a very ingenious and useful affair.

Poland China Swine.—At first this breed was a "mixed lot," but having qualities which commended them to the farmers of the great pork-producing States, they have, by a course of careful selection and breeding with a definite object in view, become well established, with characters apparently as well fixed as those of older breeds. Prominent in bringing about this result, are the D. M. Magie Co., Oxford, O., who have long found the advertising columns of the *American Agriculturist* an excellent medium for making their wares known. The fame of these swine has reached other countries, and we not long ago announced a shipment of them by the Magie Co., to England. We now learn that six of the animals are on the way to some of our wide-awake friends in Australia, and we hope to hear of their safe arrival. The Poland Chinas have made an excellent showing at the fairs this fall, and have carried off many prizes. We are all the more pleased to record the success of this breed, from the fact that it is American.

Seed Potatoes for the South.—A correspondent who sends seed potatoes largely to the Southern States, informs us that many are lost when sent in the spring by being frozen on the way, and suggests that the many readers of the *American Agriculturist* who send North every year for their seed potatoes, will consult their own interests if they order in the fall instead of delaying it until near their planting time, which occurs long before cold weather is over with us in the North.

Seedling Peaches.—Every year, several specimens of seedling peaches are brought to us, some of them of real excellence, though the majority, while large, are coarse-grained, lacking in sweetness, and very late. Some very fine seedlings were grown by Mr. Thos. B. Briggs, in 73d St., New York City, one of which was regarded of sufficient merit to receive an award at the late exhibition of the N. Y. Horticultural Society.

A Handy Household Implement is Hunter's "Rotary Flour and Meal Sifter." It is a scoop with a wire gauze bottom within which are rotating wires turned by a crank at the end of the handle. It is one of those practical, convenient things that recommend themselves at first trial; is used as a general sifter or strainer.

Disease in Hogs.—"M. T. T.," Parksville, Tenn. Anthrax fever in swine results in black spots in parts of the body and on the mucous membranes, often about the eyes and mouth. These ulcerate, or become open sores, which suppurate. The eyes are sometimes sloughed away, and entirely lost. The cause may be, and probably is, malarial; the blood is poisoned, and the disease is often rapidly fatal. The proper treatment is, to give medicines which shall act on the bowels and kidneys freely, in order to remove the poison, and then to give tonics. More particular directions cannot be given without knowing the facts of the case in question.

Treatment for Curb.—"M. F. C.," Portage Co., Ohio. The treatment for "curb" consists in the use of a high-heeled shoe, to relieve the tension of the tendon and ligament of the hock, and the use of cooling lotions. A solution of one ounce of saltpetre in a pint of water may be useful. After the inflammation is removed, a blister is usually applied. In bad cases, and when the trouble is hereditary from bad breeding, no permanent cure can be effected.

"Model Homes," By Palliser, Palliser & Co., Architects, Bridgeport, Conn. This is a collection of designs for dwellings of various sizes and costs, barns, school-houses, village churches, etc., most of which have been already erected. We are glad to notice one peculiarity of the designs; there is no attempt to hide the roof, but this, the most expressive portion of the building, has everywhere the importance and dignity that belongs to it. The designs and plans, plainly engraved, are accompanied by descriptions which give instructive hints. Sent by the Orange Judd Company, post-paid, for \$1.00.

Oats for Milk.—"W. K.," Kanawha, W. Va. Sheaf-oats cut up, make a very poor feed for milking cows, unless in connection with other feed. It would be better to thrash and grind the grain, and feed it with wheat-bran and corn-meal, and cut straw and hay.

"Lessons in Cookery."—Hand-Book of the National Training School for Cookery (South Kensington), London. Edited by Eliza A. Youmans, and published by D. Appleton & Co. This is, to us, a very interesting

book, in showing the course of instruction in the great English school. It starts with the supposition that the pupil knows nothing whatever. It does not exactly say, "To peel potatoes: (1.) Take some potatoes; (2.) Take a knife; (3.) Take the potato up in your left hand; (4.) Take the knife in the right"—but its directions are quite as minute, and appear to leave no possible chance for a mistake. At all events, the recipes seem to be excellent, and we welcome this as a useful addition to our kitchen literature. Sent from this office for \$1.50.

Seed Sower.—"A. P.," Madalin, O. The Calhoun Broadcast Seed Sower is a useful machine, easy to manage and economical of labor. It is used by a large number of persons in every section of the country. The manufacturers are the "Goodell Manuf'g Co.," Autrim, N. H., or it can be had by getting up a club for the *American Agriculturist*. See Premium List, pages 439-448.

Effects of Old Age.—"H. B.," Trumbull Co., Ohio. When a horse is 20 years old, he may be expected to show the effects of old age. These frequently appear in weakness of the bladder, and incontinence of urine, as well as in weakness of the loins; due often to partial failure of the nervous system proceeding from the spinal cord. Relief may perhaps be found in applying mustard to the loins, or between the thighs below the tail. Two grains of cantharides may be given once a day, for a few days. Do not expect permanent relief in so old a horse.

Inflammation of the Udder.—"G. N. S.," Pike Co., Pa. Inflammation of the udder is manifested either by bloody milk or by a hot swollen condition, without any milk, or with but little, and that clotted and stringy. In a recent case in the writer's herd, the treatment was to foment the udder with warm water for 15 minutes; and then to rub well into the skin, a tea-spoonful of a mixture of 7 parts of glycerine with one part of iodide of potassium. This, with frequent milking, removed the trouble in a few days, and left no ill effects.

Disease in the Feet of Sheep.—"J. W. D.," Texas. Foot rot in sheep presents different appearances under different circumstances. Sometimes it appears as granular, inflamed, and very tender growths beneath the sole; when the diseased sole sloughs off, these project beyond the horn, and cause lameness. There is then no ulceration or fetid discharge, but the sores may appear afterwards. The proper treatment is to use a mild caustic, such as sulphate of copper (blue vitriol). Make a salve by thoroughly mixing one pound of finely powdered sulphate, and four pounds of lard; apply this to the feet freely, after having washed them clean. If possible, a piece of cloth should be tied around the foot, to prevent the salve from being rubbed off, and thus delay the cure.

Indigestion in a Cow.—"F. J. G.," Almont, Mich. When a cow suffers from indigestion, the mass of food in the panceh ferments and produces gas, which causes "bloat." In some cases this passes off in a few hours; otherwise the cow dies of suffocation from pressure upon the lungs. A remedy, is to place a billet of wood between the open jaws, and tie it fast to the horns. In her efforts to get rid of this, the cow voids the gas and is relieved. When the trouble is frequent or regular, medicine is needed. Give a pint of linseed oil, and after it, half an ounce of ground ginger, and half an ounce of carbonate of soda; this is to be mixed with the food.

Paralysis in Pigs.—"B. C.," Eden, Ohio. When pigs are paralyzed in their hind quarters, a disease of the spinal cord prevents action of the nerves which proceed from that center, and causes loss of muscular power. As the nerves of the digestive organs proceed from the spinal cord, digestion fails, and the appetite is lost. If it does not recover, the pig dies of starvation and inanition. The remedy is to apply mustard to the loins, and to give half an ounce of saltpetre or turpentine, to cause action of the kidneys. This disease is caused by exposure to damp, cold, and filth. One cold rain, after the pigs have been turned out to pasture, has been known to bring it on.

Store Butter.—"J. P. D.," W. Va. There is no book on dairying that we know of which treats specially on management of butter received at country stores. This comes in a variety of kinds, colors, and qualities, and needs the most careful mixing to present a decent appearance. The "Rotary Butter Worker," illustrated in the *American Agriculturist* of August, 1877, would be useful for the mixing of such butter. When butter is melted, it will not return to its former condition, it loses its granular character. In re-working butter it is a good plan to put it into cold, salt water, and slice it down thinly, to get rid of the butter-milk and other impurities; then work it over, using cold water freely in the working. Then salt it sufficiently, work once more, and pack in firkins in layers of two or three inches. The grain will,

of course, be lost to some extent, but it is impossible to make common butter into a first class article by any process whatever. It can only be made passably good.

Purulent Ophthalmia.—"J. R. D.," Ellsworth, Kas. This disease in cattle is very similar to that in mankind. It is contagious, the virus being conveyed by contact. It usually spreads through a herd for the reason that the discharge from the eye is conveyed by litter or from rubbing posts or other places, from one animal to another. It is a disease of the blood, and a pregnant animal communicates it to the fetus, in which it appears at birth or becomes constitutional, appearing perhaps years after. The usual treatment is to bleed the eye by cutting the skin and veins at the inflamed lower corner of the organ, and bathing the part with warm water to induce bleeding freely. The feed should be cooling and laxative; half-ounce doses of sulphate of soda should be given daily for a week or two, mixed well with the food, and the eye washed with a lotion of one grain of sulphate of copper to one ounce of water.

Milk-room with Ice.—"B. W.," Lake Co., Ind. There are some reasons why it is best to have a milk-room quite free and separate from an ice-house. An ice-house is damp, and mould gathers about it. The packing around the ice slowly decomposes, and gives off an odor, which is communicated to the milk. The ice is either consumed wastefully, or else it does not reduce the temperature in proportion to the consumption. After some experience, the writer prefers a well-constructed milk-house, if possible with a stream of pure spring water passing through it in pipes, or in a convenient tank, and nothing else beyond the usual dairy appliances.

PRICE, POST-PAID, \$1.50.

ORANGE JUDD CO.,
245 Broadway, N. Y.

An "A. 1" REVOLVER FOR \$2.50.

THE ALEXIS.

With Russian Model Stock, full nickel silver plate, and hand engraved, 7 shot; uses the extra long Rifle cartridge, and will kill at 100 yards.

These Revolvers cost over \$6 apiece to make, and it is the greatest bargain ever offered in this country. They are equal to a Colt's Vesson in every particular, and superior in some. The barrel is octagonal and extremely long, and rifled deeply its entire length. The new model handle gives a firm grip and prevents throwing up. **All parts are interchangeable and readily duplicated at any time.** It is the most beautiful and accurate Revolver that has yet been made; elegantly shaped and designed, and made by the best workmen in the United States, and for self-defense is unequalled. **Perfect satisfaction guaranteed or money cheerfully refunded.** It can be had for \$3 anywhere, and is cheap at that price. We will send it C. O. D., with privilege of examining at express office, to any point east of Iowa, on receipt of \$1, which will be deducted from the bill; or on receipt of cash in full will give you a box of long range cartridges, or will send by mail for 20 cents extra. Cleaning brush and rod go with every one in a nice box. **Prices:** Ebony stock, \$2.50; engraved Rubber stock, \$3; Ivory stock, \$3.75; and Pearl stock, \$4.50. This is the biggest and most extraordinary bargain we ever have or shall offer. Remember your money returned if it is not exactly as we state. This Revolver is all English steel, no cast-iron. The country is flooded with cheap, worthless Pistols. Buy a good one while you are about it. Orders filled promptly. **Bay State Arms Co., 33 WATER STREET, Boston, Mass.** This is just the weapon for Bankers and Police, self-defense, and target practice.

An advertisement of the above Revolver appeared in the October number of the American Agriculturist, and we could nearly fill this page with the names and testimonials of purchasers. Every one is more than delighted. We take the liberty of herewith mentioning the names of a very few of the hundreds of Agriculturist readers who have bought, some of whom you may know:—B. C. Merritt, Little Geneva, N. Y.; G. H. Hale, Weston, Ill.; A. N. Williams, South Manchester, Conn.; J. F. Warner, Moscow, Penn.; F. A. Strong, Erie, Pa.; Samuel C. West, Pittston, Pa.; Geo. M. Wentworth, Hittfield, Mass.; W. F. Locke, Ottawa, Ill.; S. L. Randall, Springfield, Mass.; Chas. B. Case, Avon, Conn.; W. A. Nolan, Wadesville, Va.; Eli Conrad, So. Gibson, Pa.; W. Pearce, Marietta, O.; B. F. Niles, Emden, Ill.; W. A. Norton, Brownsville, O.; Wm. Shively, Atwater, O.; I. W. Ireland, Eckley, Penn.; G. W. Perry, Amboy, Ill.; A. L. Sellers, West Chester, Pa.; E. A. Brown, Ridgeville, Ontario, Can. Dozens more could be added. "The proof of the pudding is in the eating." Our references are purchasers themselves. The following notice appeared in the Saturday Evening Post, October 5, 1878, direct from the editor's pen, and more than substantiates any statement we make regarding this remarkable and unequalled bargain. We have examined the Alexis Revolver, advertised in another column, and take pleasure in recommending it to our readers. No written description can do it justice. It is all and more than its enterprising manufacturers claim for it.—Editor Post.

A GOOD STEM WINDING WATCH!

This is the biggest bargain ever offered in Watches in this country. They all have fine English nickel works, heavy bevelled-edge pebble crystal front, and the cases are genuine Allanoide, which has just taken the first prize as the nearest and best imitation of GENUINE GOLD; in fact, this Watch exactly resembles a \$100 Gold Watch. It is a Stem Winder (no key to carry around and lose); it is guaranteed a first class and accurate time-keeper, and would be cheap at \$15. Our price is \$6.50 by express, or \$6.75 by registered mail. For sportsmen who do not wish to carry their expensive Watch on gunning trips, this is specially adapted, and the difference would never be detected. No. 2 is a similar Watch to above, key winder, sunk second, full hunter's case, and genuine full jewelled American works, same as in a fine gold or silver Watch, and is an exact counterpart of a \$150 Gold Watch. Price, \$8; by registered mail, \$8.25. No. 4 is the same in SOLID COIN SILVER cases, ELEGANTLY ENGRAVED, and as good as any \$25 watch in America. Price, \$11; by registered mail, \$11.25. The above Watches are guaranteed by us in every respect. They were taken by us in exchange for other goods, and are offered for the next 60 days to close them out at lower prices than were ever quoted on similar goods. Satisfaction guaranteed. Bay State Arms Co., DEALERS IN FIRE ARMS, SPORTING GOODS, &c., 93 Water St., Boston, Mass.

Wells, Richardson & Co's Perfected Butter Color

THE GAME OF THE SEASON!

Horsman's Parlor Archery.

[PATENT APPLIED FOR.]

In view of the great popularity attained by ARCHERY during the past season, and the repeated inquiries that have been made from time to time for a substitute that might be used during the WINTER MONTHS, the inventor has succeeded in adapting the game to the parlor; and in "HORSMAN'S PARLOR ARCHERY," he feels assured that this latest innovation in the way of GAMES will meet a special want and be largely made use of among all families.

The great beauty of this invention is that it is a perfect substitute for Field Archery, the same degree of skill being requisite to hit the target as is required in the field; a match therefore will be as much in order in the dining or drawing room after dinner, as it has been on the lawn before lunch during the summer.

The Bow and Arrows are so constructed and guarded that injury to the Walls, Windows, Mirrors, Furniture or Carpets can be entirely avoided. A "Set" consists of one Bow, six Arrows, a frame and canvas, on which is also the target.

WELLS, RICHARDSON & CO., Propr's,
Burlington, Vt.

LOOK WELL TO YOUR

HORSE'S FEET.

This drawing shows how many horses are made lame and permanently injured by the use of the cold-cut and sheared pointed nails. This process of manufacture produces lamination, causing the iron to form in layers, and when driven into the foot the horny fibres of which the hoof is composed cause the nail to separate at the point, and one portion passes into the foot.

It requires but little observation and reflection, one would think, to arrive at the conclusion as to the kind of nails to be used, whether a mangled piece of iron, rendered DANGEROUS by the Cold-Rolling and Shearing process, and liable to sliver in driving, thus,

or one made from the rod at a welding heat, where all the fibres remain intact, and a perfect oneness maintained, and which being pointed by the hammer renders such an accident as slivering utterly impossible.

"The Hot-forging process is the only sure manner of making a true driving and safe nail."

REV. W. H. H. MURRAY,
Golden Rule, October 31, 1871."

"After long usage, can safely recommend to all owners of track and light-harness horses your Hot-Forged Horse Shoe Nails. I consider all sheared nails unsafe for shoeing."

Respectfully yours, BUDD DOBLE."

The only Hot-Drawn and Hammer-Pointed Horse-Shoe Nail in the World

that is not cut, clipped, or sheared upon the point, and will not split in driving, is made by the

Auction Sale of Jerseys.

Will be sold without reserve to the highest bidder, on Thursday, November 7th, commencing at 11 o'clock, A. M., at the farm of the subscriber, in the city of New London, Conn., 50 head of thoroughbred and grade Jersey Heifers and Cows, and 5 thoroughbred Jersey Bulls. The thoroughbreds have descended from the early importation of John A. Taintor, Esq., of Hartford, Conn., and can not be equaled by any late importations from the Island of Jersey, if selected by experts, without limit in price, for the reason that they do not breed such, on that island, at present, nearly all the grades are crossed with Ayrshire blood, and have been proved as good cows as were ever bred. 25 of the heifers, less than two years of age, have run in the pasture since Aug. 25th with the best thoroughbred Jersey bulls, and are supposed to be in calf. 25 of the heifers and cows are 2 to 9 years old, now in milk, several fresh, desirable family cows. The bulls are 2 months to 4 years old, all are beautiful in form and color, little white on any, none of them are recorded in the "American Jersey Cattle Club Register." Every one of them will make a good butter record in the hands of a new purchaser.

AMERICAN AGRICULTURIST.

ORANGE JUDD COMPANY, Publishers, 245 Broadway, N. Y.
ANNUAL SUBSCRIPTION TERMS (always in advance):
\$1.50 each for single copies: Four copies, \$1.25 each:
These rates include Postage, in each case, which is pre-paid
by the Publishers. The papers are addressed to each name.

Good Things Free For Our Friends!

For Men, for Women, for Children—of All Occupations!

Large Pay for Little Work.

The following pages describe a variety of Pleasant, Useful, and Desirable Articles, which the Publishers of the *American Agriculturist* will Present (free) to any friends who render a little assistance by collecting and forwarding few or many names of new and old subscribers.

There is not a Man, Woman, or Child, anywhere, in all the Country, who reads this, who can not easily get two or more others to join him or her in taking the Paper, and thus secure FREE one, or more than one, of the desirable Articles described in the following pages.

Tens of Thousands of people have secured premium articles in this way. With lower subscription rates this year, and fewer names required to get the same article, hundreds of thousands may now obtain them. YOU may get one or more of them. Everybody wants a paper like the *American Agriculturist*, and will take it if it is shown and explained to them—its beauty, its value, its instructive character, its engravings, etc.

N. B.—Every article described in the following pages is new, first-class, and warranted to be just what it is described to be. Every article sent out will be new from the factory, of the latest and best manufacture.—No better can be obtained anywhere. Every article is put down at its regular cash price, and is just as valuable as so much Cash, for Use, for Sale, or for a PRESENT to a friend.

Many New Things are added to this year's list, while those most called for last year, are retained, so that others also may have an opportunity to get them.]

Better Terms Than Ever Before.—While the subscription terms are lower, fewer names are required to get the same premium. Thus, for example, last year, to get the \$5.50 premium (No. 8), required 13 subscriptions at \$1.60 (\$20.80); this year, only 9 subscriptions at \$1.50 (\$13.50), are needed. Similar reductions are made in other articles. (This results from the lower cost of printing paper, all the benefit of which we give to our premium takers). Any one can well afford, if necessary, to gather names at the club rates, and himself add the small difference, where there is any, between the club rate and the premium rate. All the premiums are warranted by us to be as represented, and they are therefore even more valuable than if bought at ordinary sale.

EXTRA PAPERS Free to NEW SUBSCRIBERS.

BEGIN NOW.—To avoid the rush near the last of the year, the Publishers will begin now to receive and

enter names for 1879. As fast as new names come in on premium lists for 1879, they will be entered and receive any further numbers issued this year without extra charge. New names on premium lists, received before Nov. 15, will get the paper for November and December, free; and those coming between Nov. 15, and Dec. 10, will get the paper for Dec., free. So send along the names at once, receive credit for them on the Premium Book, and call for the premium whenever you desire.

This offer of extra numbers of the Paper to NEW subscribers will induce many to subscribe AT ONCE.

If the Reader only knew the good quality and real value of these Premium Articles, and how easy it is to show the American Agriculturist to some friends and neighbors, tell them its value, and ask them to try it a year, and thus gather a few subscribers, and himself receive the premiums, he would take hold of it at once.

*** There are from 25 to 500 families, or more, in the vicinity of each Post Office, every one of whom would be benefited by having this Journal for a year, at a cost, postage included, of 3 cents a week. From one to a dozen premium clubs, small or large, may be gathered in the vicinity of each Post Office, and as many premiums be obtained. YOU may get one or more of them.

A GENERAL PREMIUM.—A free copy to Sender of a Club of 20 Subscribers, at \$1 each, without other Premiums. Instead of extra copy, any one sending 20 or more subscribers at \$1.00 each may select any premium offered in this Sheet, to the amount of 10 cents for every subscriber sent by him or her. Thus, any one sending 80 subscribers at \$1 each, may select any \$3 premium, or any two of which the price amounts to \$3. And so of any other premium, or List above 20.

GOOD BUSINESS OPENING.—While most persons only collect Premium Clubs among friends and neighbors, at odd hours, evenings, or rainy days, many do it as a regular business for several months each year—collecting names, receiving the premiums and selling them. (They are all good, and sell readily.) They thus realize an income off from \$100 to \$1,000—sometimes more.

Explanatory Notes.

Read and Carefully Note the following Items: The Table on this page tells the name and cash price of each article, and (in last column but one), gives the number of names sent in at the regular price of \$1.50 a year that will secure any premium article. (The last column gives the number of names at the lowest club price for four names, that is \$1.25 each. Some persons quickly raise large clubs by taking all the names at \$1.25 each, or less, and themselves pay the difference, and even thus get the premium articles very cheaply.) (a) All subscribers sent by one person count, though from several different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium.... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any one can have any time desired, up to next June, to complete any list, but every premium desired will be sent as soon as earned and ordered.... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts.... (e) Old and new subscribers all count in premium clubs, but a portion at least should be new names; it is partly to get these that we offer premiums to canvassers.... (f) One or two Specimen Numbers, etc., will be supplied free, as needed by canvassers, (when 3 cents per copy is furnished to pay for mailing), but extra numbers are expensive, and should be used carefully and economically, and where they will tell. Other specimen numbers will be sent, post-paid, to canvassers only, for 10 cents each. The price to others is 15 cents.... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways will be safe against loss.

The Premiums Nos. 4 to 8, 10 to 15, 17, 21, 22, 24, 26 to 29, 32, 33, 37 to 41, 48 to 51, 88, 89, 99, 101 to 108, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. [OVER.]

No. 1.—Boy's Tool Chest.—Every Boy in the United States or elsewhere ought to have this; or better, No. 2; or better still, No. 3. No. 1 has 12 assorted tools, in a neat hinged-lid box, made of ash, with walnut moulding. Just the thing to encourage the mechanical genius in boys. Made by E. I. HORSMAN, 80 and 82 William St., New York City. Three subscribers at \$1.50 each will secure one free. [It will be sent for \$1.00 cash.] Receiver to pay expressage.

No. 2.—Boy's Tool Chest.—Larger than No. 1, and containing twenty-one tools. From same manufacturer. Only five subscribers at \$1.50 each will secure one free. [Or one will be forwarded on receipt of \$2.50 cash.] Receiver to pay expressage.

No. 3.—Boy's Tool Chest.—Still larger than No. 2 and from same maker. This contains thirty-two tools, and will be a fine present for any boy. Eight subscribers at \$1.50 each will secure it free. [It will be sent for \$5.00 cash.] Recipient to pay expressage.

No. 4.—Patent Magic Bell Head Pencil.—This is a very pretty and convenient gold-plated Pocket Pencil, which is extended or closed by pulling or pressing the head. This premium and the four which follow, are from the well known manufacturers, LUDDEN & DOW, 192 Broadway, corner of John St., New York. Mr. Ludden has been in the business 38 years, and we know and can highly commend his work. Only four subscribers sent us at \$1.50 a year secure one free, post-paid.—[We will send one, post-paid, for \$1.50.]

Nos. 5, 6.—Magic Charm Pencils.—These are gold-plated and very beautiful. We offer two kinds, the smaller, an exceedingly tasteful thing for ladies, and a larger style for gentlemen. Each style has

a ring at the head for attaching to a watch-chain. By same makers as No. 4. 4 to 5 subscribers will secure one free, post-paid. (See Table.)—[We send the ladies' size, post-paid, for \$2, and gentlemen's size for \$2.75.]

No. 7.—Gold Pen, Telescopic Case.—Gold-plated case containing No. 4 Diamond-pointed Gold Pen, warranted. Same makers as No. 4. Only 5 subscribers sent to us at \$1.50 each, will secure this splendid article free and post-paid. In sending for this pen indicate how you wish the pen—whether you desire it to be stiff, medium, or limber.—[We will send one of these fine Pens, post-paid, on receipt of \$2.50.]

No. 8.—Gold Pen and Pencil (Combined).—A very elegant premium. The handsome, heaviest gold-plated case contains a No. 7 Improved Telescopic Pen and Pencil. The pen slides out, the pencil is turned out by a screw, and there is a chamber for leads in top. By same makers as No. 4. This is richly worth

the little effort to collect 9 subscribers at \$1.50 each to secure it free.—[We will send one, post-paid, for \$5.50.]

No. 9.—Little Girl's Wash Set.—Composed of six pieces, viz.: washboard, wringer, pail,

clothes-horse, scrub-brush, and brass-bound tub 10 inches in diameter. From same manufacturer as No. 16. Two subscribers at \$1.50 each will secure it free. [Or it will be sent for 75 cts. cash.] Receiver to pay expressage.

No. 10.—Parcheesi.—This game is designed so plainly and attractively that it is quickly comprehended by children, and also excites interest in the oldest players. It is bound in durable, handsome paper, with eight dice, sixteen brass-bound counters, and directions for playing. From E. G. SELCHOW & Co., 41 John St., New York. We send it free, and post-paid, for 4 subscribers at \$1.50 each; or will forward it prepaid, for \$1.62.

No. 11.—"Go-Bang."—The new East India parlor game. It is having a large sale, and is pronounced by many, the best parlor game of the day. Directions for playing it, accompany each one. From same firm as No. 10. Sent free, and post-paid, for 3 subscribers at \$1.50 each, or it will be forwarded post-paid, for \$1.20. [For 5 subscribers at \$1.50 each, we will send two sets free.]

SLICED OBJECTS

SLICED BIRDS SLICED ANIMALS

Nos. 12, 13, 14.—Sliced Objects; Sliced Birds; Sliced Animals.—These pleasing, dissected puzzles, or "sliced" objects, etc., are designed to attract and interest the little folks, as they invariably do, and at the same time help them in learning to spell. The engraving of a "Boat," shows how the objects, animals, etc., are divided into sections. They are very popular with the children, as they are got up in attractive style. From E. G. SELCHOW & Co. Any one of these three Premiums will be sent for only two subscribers at \$1.50 each, or one will be forwarded, post-paid, for 65c. Mention the one desired. All Three for 4 subscribers at \$1.50 each.

No. 15.—Vignette Authors.—This game consists of 72 cards, each card having a handsomely engraved portrait of an author, his name, and three of his works. The cards are finely ornamented with flowers, and are a new style. From E. G. SELCHOW & Co., 41 John St., New York. We send them, post-paid, for 2 subscribers at \$1.50 each; or we will forward them, pre-paid, for 60 cts.

No. 16.—Portable Writing Desk.—Always handy, especially for the young folks. Closed, it is a 13-inch square black walnut desk, with gilt ornaments. From C. W. F. DARE, 47 Cortlandt St., New York City. Three subscribers at \$1.50 each will secure this free. [We will send one for \$1.25 cash.] Receiver to pay expressage.

Premium 16—Opened.

No. 17.—Chess-Men.—These are, of course, to be had at all prices, according to quality. The set we offer is neat and serviceable. The figures are of boxwood and ebony, with large bases to prevent their turning over. From same firm as No. 10. Sent prepaid for 6 subscribers at \$1.50 each; or forwarded, for \$3.20.

No. 18.—Walnut Work Box.—A pleasing gift for a young Miss. It is a 12-inch solid walnut Box, cushion, etc., inside velvet finish. From same manufacturer as No. 16. Three subscriptions at \$1.50 each will secure it free, [or it will be sent on receipt of the price, \$1.15.] Receiver to pay expressage.

No. 19.—Boy's Wagon.—Just the thing for the active little "drivers" at home. This Wagon has iron axle, and heavy round tire wheels, painted and ornamented with bright colors, has hnb caps and seat, with 28-inch body. From C. W. F. DARE, 47 Cortlandt St., New York. A

father, mother, or older brother or sister ought to easily collect the 8 subscribers which will get this free.—[Or we supply one for \$4.50.] Receiver to pay expressage.

No. 20.—"Our Boys' Wagon."—For the use of Boys from 6 to 15 years of age. The bed is 2 ft. 8 in. long, 1 foot 3 in. wide, and 5 in. deep. The wheels are all iron, the spindles also of iron. It is finely painted, a first-rate and handsome wagon, and will carry a weight of 400 to 500 lbs. on a level road. Made by the Silver & Deming Manuf'g Co., Salem, Ohio. 12 subscriptions, at \$1.50 each, will secure it, or we will supply one for \$8. The freight from the factory in either case to be paid by receiver.

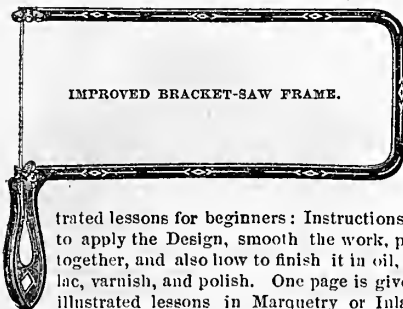

No. 21.—Improved Bracket-Saw Outfit.—(See engraving, top of next column.) The great pleasure and profit enjoyed by thousands of young readers in using the Bracket-saws, of which we have given many away in past seasons, assures the success of this Premium. The "Improved Outfit" consists of: 1 Beautiful Box; 1 Steel Saw Frame, Japanned and Finely Ornamented; 50 Bracket and Ornamental Designs; 1/2 Doz. Steel Saw

Blades; 1 Brad Awl; 1 Piece Sand Paper; 85 Miniature Designs, of full size, with a price list; 1 Manual of In-

Premium 21

structions, 12 pages, Illustrated, giving description of all tools and woods used in Bracket Sawing; Five illus-

trated lessons for beginners: Instructions how to apply the Design, smooth the work, put it together, and also how to finish it in oil, shellac, varnish, and polish. One page is given to illustrated lessons in Marquetry or Inlaying work. For only 3 subscribers at \$1.50 each, we will send this free; or we will supply it, post-paid, for \$1.18.

No. 22.—Bracket-Saw Drill, No. 1.—A very useful little tool. The Drill Stock, and Six Drill Points, and Wrench, are packed in a box. For only Three subscribers at \$1.50 each, we will send the Drill, or we will supply it to any one, post-paid, for \$1.15.

No. 23.—Buck and Saw for Boys.

—Suitable for the little fellows from 4 to 8 years old, and it will please them. From same manufacturers as No.

16. Two subscriptions at \$1.50 each will secure it free. [Or it will be sent for 50 cts.] Receiver to pay expressage.

No. 24.—Eagle Soap Bubble Toy.

It would be hard to find the boy or girl who has never enjoyed "blowing soap bubbles." Here is a Toy invented to help the little folks in this operation, and it does it in a way to fill them with delight. It is claimed that 300 bubbles can be blown from one without refilling. Four of these toys will be given for this Premium, and almost any child can readily get 3 subscribers, at \$1.50 each, and thus secure one Toy for himself, and 3 others to give away; or we will send four of them on receipt of \$1. Directions accompany each one. E. W. Bliss, General Agent, 34 Barclay St., New York.

No. 25.—Citadelle—A Pleasing

Parlor Game.—Size of Board, 10x38 inches, with Balls, Cues, etc. Each player has five turns in securing the ball against the Citadel. The most accurate marksman will score the highest number of points and win the game. WARNER & Co., Northampton, Mass., are the makers. Three subscriptions at \$1.50 each, will secure this Game free; or we will forward one on receipt of \$1.00. Expressage to be paid in either case by Receiver.

No. 26.—Companion Autograph

Album.—It has embossed gilt covers, round corners, and gilt edges. Fac-simile Autographs of Whittier, Longfellow, and Bryant, are embossed in gilt on the cover. Collecting and preserving the autographs of friends and others is a charming custom. There is also a great curiosity on the part of almost every one to see the autographs of distinguished people, and the Album which contains such names is highly prized. The COMPANION AUTOGRAPH ALBUM is one of the most attractive and valuable ever offered to the public. Besides the ordinary blank pages for collecting autographs, a new feature of great value is added. Over thirty of its 125 pages contain fac-simile autographs of distinguished poets, historians, statesmen, journalists, essayists, and novelists. In addition, in the hand-writing of the authors, are reproduced stanzas from several famous poems. These have been taken, in most cases, directly from the original manuscript, which adds great value to the collection. Sent free for 3 subscribers at \$1.50 each; or we will supply it post-paid, for \$1.00.

No. 27.—Embroidery Frame.—With the Embroidery Frame is also suitable canvas and 3 Design Books. It is made of cherry wood, highly polished. The Frame is in size, 9x10 inches. The Canvas on which the embroidery is to be done, is first fastened to the frame, as seen in the cut, and then, by turning the screws of the Frame, the Canvas is made tight, so that designs can be worked most beautifully, and with great ease and rapidity. Sent free for 3 subscribers at \$1.50 each; or we will supply it post-paid, for \$1.00.

No. 28.—Crandall's Improved Building Blocks (No. 3) furnish a most attractive

amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes accompanied by an Illustrated Sheet giving various designs of buildings, etc. This is one of the most successful toys ever invented. Hundreds of thousands are in use. Two subscribers, at \$1.50 each, will secure you a free box, delivered free. —[Or we will send a box, pre-paid, for 90 cents.]

No. 29.—Crandall's District

School.—This very amusing group of teacher and scholars in the "district school," will delight every Child, and Man and Woman too. The grave "Master," seated by the desk, with his "whisking stick"; the boys and

girls with their books; the "Little Lamb" that has followed Mary to school; the "Dunce" and his cap, and the altogether comical appearance of the whole company, make this one of the most attractive toys of Crandall's invention.—Three subscribers at \$1.50 each, will secure a box, carriage prepaid. [We send one, post-paid, for \$1.20.]

[JUST OUT.]

[BEST TOY EVER PRODUCED.]

No. 30.—Crandall's Happy Family.

—A splendid new Invention of C. M. C.—The fifteen animals, with their keeper, are well made, strong, durable, and wonderfully true to nature. They can be arranged in an endless variety of positions and

combinations, producing the most vivid and startling effects. When not in use they can all be packed away in the box, which is neat and strong; when the wheels alone are adjusted, the owner has a nice wagon; when the ornaments are placed in position—a beautiful cage, or travelling show; and when the animals are added to this, and set up, as any wide-awake child can arrange them, the effect is "stupendous!" A Toy so complete, or so comprehensive of the wants and tastes of children, as this, has never before been offered. It is not only a "Happy Family" itself, but carries the spirit of happiness into every family where it goes, filling the heart of its fortunate young possessor with delight. Only 4 subscriptions at \$1.50 each will secure this attractive toy free. [Or we will supply one for \$2.00.]—Expressage to be paid by receiver.

No. 31.—Crandall's Heavy Artillery.

—The greatest amusement of the age! Recreation at home for all ages, and for all seasons! Crandall's Heavy Artillery is made up of a large Cannon, complete, which throws a 1½-inch Rubber Ball to the distance of 30 feet or more, and Sixty Blocks (Red, White, and Blue), to build up Fortifications; also a Company of Soldiers, with Officer and Flag, to Garrison the Fort. The Game is to heat down the Fort by the use of the Big Gun, and hit the Soldiers, Flag, etc., each of which counts one to five, in making up a score. One can use it alone for artillery practice; and two or more can use it in competition, the

same as in target practice, or Ten-pins, or Croquet, or Billiards, for all of which it is a good substitute, to be used at home, in any room, and at any time. Rules, Illustrations of a variety of Forts, etc., accompany each

Premium 31

CRANDALL'S HEAVY ARTILLERY.

box containing the set, and the box is 18 inches long, 6 inches high, and 8 inches wide. Six subscriptions at \$1.50 each will secure this. [Or, we will send it on the receipt of \$3.00.]—Expressage to be paid by receiver.

No. 32.—Crandall's Chinese Blocks.—In this most attractive combination, Mr. Crandall gives us the original Building Blocks, with an

entire Chinese Family, the various blocks and figures being brilliantly colored. With a single Box, which contains a Set, one can build Chinese Houses, Palaces, Pagodas, Gardens, etc., etc. Thousands of structures of the Chinese style can be made with a Box of these fascinating blocks and figures. Only 3 subscriptions at \$1.50 each, will secure this free, carriage pre-paid to any part of the United States. [Or we will send a box anywhere in the United States, prepaid, on receipt of \$1.25.]

No. 33.—Companion Tool-Chest,

No. 1.—This combination is well adjusted, and it is a convenience for the Family, Store, and Workshop.—It combines: A Rosewood Plane; One Gouge; One six-inch Boxwood Rule; One Medium Chisel; One inch Cutter, used also as a Chisel; One Screw Driver; One Saw; One Awl; One Gimlet. These tools are all made from the best cast steel. The chuck is beautifully Nickel Plated. It will hold a tool as small as a pin head. They are packed in a handsome box. For 4 Subscribers at \$1.50 each, we send this free; or supply it to any one, and send it, post-paid, for \$1.50.

Nos. 34, 35, 36.—American Table Cutlery.—Useful, very desirable, well tempered, and wanted by everybody! We are glad to be able to offer

really good articles of American manufacture, such as are competing successfully with the best foreign make. The MERIDEN CUTLERY COMPANY, who supply them to us, recommend these Knives as equal to any Cutlery in the market, and their recommendation is a guarantee wherever they are known. We offer two kinds of Knives, and three sizes of each kind. No. 34 have Rubber Handles, which are actually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Premium 34 is the Desert or Tea size, sold at \$14.75 per dozen.... We present of these twelve knives and twelve forks to anyone sending only 19 subscribers at \$1.50 each.... For 22 subscribers, at \$1.50, or 41 at \$1.25, we will give either the medium size, or the large Dinner size, sold at \$15.70.—Premium 35 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful articles; they are the Tea or Dessert size, which, with forks, sell at \$18.50. Only 24 subscribers, at \$1.50 each, secures these.... For 28 subscribers at \$1.50, or 52 at \$1.25, we will send the medium size, or the Dinner size, sold at \$21.20.... For 30 names, at \$1.50, or 57 at \$1.25, we will send the larger Dinner size, sold at \$22.50. The Forks, which accompany these Premiums, (Nos. 34 and 35,) are made of genuine Alabata, and warranted double-plated with coin-silver. These Forks are furnished to us by the MERIDEN CUTLERY Co.... Premium 36, the Carving-Knife and Fork (given for 7 subscribers), are made by the MERIDEN CUTLERY Co., with best Ivory, balanced Handles. They are beautiful, and serviceable articles for daily use. These premiums are very useful and desirable, and have been secured by many persons in past seasons. —[We will send any of the above named articles, on receipt of the price specified, in cash, or named.] Purchaser to pay expressage.

Nos. 37, 38, 39, 40.—Pocket Knives.

—HERE'S FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one, for merely a little effort. Any boy or girl can easily collect 4 to 5 subscribers, and receive one of these fine premiums free. (see table, page 439). These knives are furnished by the MERIDEN CUTLERY Co., 49 Chambers St, New York, whose work is equal to any done in this country or Europe. No. 37 is a neat, substantial Knife, with three blades and buck-horn handle. No. 38 is a still finer article, with four blades and pearl handle. No. 39 is an elegant Knife, with five blades and shell handle. No. 40 (see Engraving) is a Lady's beautiful Pocket Knife, with four blades and shell handle.—[Any of these knives will be sent by us, post-paid, on receipt of the price, in cash, as named for each in Table, p. 439.]

No. 41.—Multum in Parvo Pocket Knife.—Boys, Read this.

[Mr. Judd's

special favorite.]

Premium 41 [Open.]

"tools" is often worth a "quarter," by being on hand and just the thing wanted in an emergency. He sent an order to England at three different times, but only received much larger, clumsier articles, less effective, and costing \$5 each, and finally learned that the original maker was dead. He then got some English cutlery here to make them, but they did not always succeed in keeping up a supply of first-class articles. We now get them all right of the MERIDEN CUTLERY COMPANY, and much cheaper than any imported. (Mr. Judd

Premium 41 [Closed.]

could find none as desirable while in London on his last visit.) The Engraving shows the parts of the knife, except the very convenient and very effective Screw-driver hidden by the opened large blade. The Saw is double-toothed, and will cut an inch board, saw off a good-sized stick, cut a notch, etc. The Hook is used to lift a stove-cover, pry open sundry things, clean a horse's hoof, pull on the boots, etc. The Punch makes holes in harness, wood, etc., which can be enlarged by its sharp corners. The Gimlet and Corkscrew are convenient, of course. The Tweezers and long Pointer, or Brad-awl, drawn from the end of the handle, often come into use. The back of the Hook makes a good Hammer for tacks, and small pounding. The inside of the Hook forms a small Nut-cracker. All close into a compact white handle, the whole weighing only 2 ounces. IT IS A POCKETFUL OF TOOLS. Seven subscribers at \$1.50 each brings it free, post-paid. —[We will send one, post-paid, for \$3.50.]

Every Family Wants This.

No. 42.—First-rate Wire Bed Mattress.—Just the thing for Every Family.—This is something we would like to see on the bed of every hard-working man and woman in the country, and it is "good

Premium 42

enough for a king." A smooth surface of woven fine wire, so "kinked and linked" that it is thoroughly elastic, yielding gently to pressure like a rubber sheet, or feathers, or a water surface, yet durable, and without the perspiration retaining surface of rubber or feathers. We have used them four years, and would not be without one for five times its cost. Many families may now secure one, free, by simply collecting and forwarding only 17 subscribers at \$1.50 each. It is called the "Farnham Improved Woven Wire-Bed," and is manufactured by HIRAM BUCKINGHAM, Chester, Conn. The only covering it needs is blankets, or mattress—enough to give warmth to the body underneath, according to the season. They are made in sizes to fit into any ordinary bedsteads. They are lasting, and require no tightening-up arrangement. They can go anywhere as freight. (Give us size wanted.) The price is reduced to \$12.00. [On receipt of this price, we will forward one to any address; or we will send one free for a premium, as above.] Freight to be paid by the receiver.

Nos. 43, 44, 45, 46.—Sewing Machines.—Your Choice of Four Kinds—Easily Obtained.

—A good Sewing Machine lightens the labor, and promotes the health and happiness of those at home." Any good sewing machine is a great treasure in any household; we would as soon think of abolishing the plow, and digging up the fields with a spade, as of being without a sewing machine. Upon the mother's health, vigor, and serenity, largely depend the child's health, vigor, and success in life, as well as his moral character. The everlasting "stitch, stitch, stitch," the bending over the work, the loss of sleep, and the lack of right exercise have brought millions to early graves, and seriously injured the health of millions upon millions. Reckoned in dollars, a sewing machine pays largely. If one cost \$500 even, the interest on that, less taxes, would be about \$32. The total sewing in most families is equal to at least 4 months of steady hand-sewing. If hired, this would cost, board included, \$5 to \$10 per week, or \$85 to \$170 a year, three-fourths of which would be saved by using a sewing machine that will work at least 4 times as fast, (cutting, basting, etc., included); or a saving of \$50 to \$100, or more, each year. We say to every man, Get your wife a Good Sewing Machine, even if you have to sell a favorite horse, or an acre or two of land, or can borrow the money—get the sewing machine, anyway. If you can get a machine through our premium list, and thus save the cash it would cost, well—but get the machine. (Multitudes have obtained them free through our premiums, by collecting

No. 43

"SINGER" MACHINE, PRICE \$30.

subscribers on rainy days and evenings. Almost any man or woman can readily do this. The premium list may be collected in your own neighborhood and elsewhere.) The machines manufactured by the **Singer Manufacturing Company**, 34 Union Square, New York, are among those most favorably known for simplicity and strength. The machine offered by us is mounted on an Ornamental Iron Stand and Solid Black Walnut Table, with Drawer, price, \$30. For work this is just as good as their most expensive machine—differing (No. 43) only in cabinet work and ornamentation. We send it free for only 37 subscribers, at \$1.50 each. Carriage

No. 44

"DOMESTIC" MACHINE, PRICE \$15.

to be paid by receiver.... The **"Domestic" Sewing Machine Company**, Broadway, corner of 14th St., New York, manufacture a machine for which is claimed the greatest simplicity, the fewest parts, all strong and with hardened conical bearings, good material, and perfection of workmanship. We offer their No. 1 "Family" machine, ornamented with bronze, and highly finished, and nickel-plated, price \$45. Sent for 52 subscribers, at \$1.50 each. Carriage to be paid by re-

No. 45

"REMINGTON" MACHINE, PRICE \$50.

ceiver.... The **Remington Sewing Machine Company**, Ilion, N. Y., or 283 Broadway, New York City, manufacture a machine which has sprung rapidly into favor, as possessing a most desirable combination of good qualities, namely, light running, smooth, noiseless, rapid, durable, with perfect Lock-Stitch. Its use is

E No. 46

"WHEELER AND WILSON" MACHINE, PRICE \$60. readily acquired, it is well constructed, and beautiful in design. We offer the \$50 machine. Sent for 60 subscri-

ers, at \$1.50 each. Carriage to be paid by receiver.... The **Wheeler & Wilson Manufacturing Company**, Bridgeport, Conn., claim for their machines, beauty and excellence of stitch, strength and firmness of seam, economy of thread, simplicity, and thoroughness of construction, and speed, and ease of management. The machine we offer, price \$60, is elegantly finished, with Back and End Leaves, Cover and Drawers, Plated, and fine finish. Sent free for 70 subscribers, at \$1.50 each. Carriage to be paid by receiver.

No. 47.—The Aquapult—A Combined Hand Fire-Engine, Portable Brass Force Pump, Sprinkler, etc., etc.—Manufactured by W. & B. Douglass, Middletown, Conn.—This is a new, simple, cheap, effective apparatus, very valuable for throwing water or other liquids for watering gardens, vines, plants, and flowers; for washing windows, carriages, etc.; for carrying promptly to any point to put out beginning fires; for pumping water out of boats, cellars, etc., etc. It will pump 5 gallons a minute, and it throws a stream readily against the second story windows, or even on to the roof of a two-story house. The stirrup, adjustable by a screw at any point according to the depth of vessel, holds the pump firmly by means of the foot, leaving one hand free to work the handle and the other to direct the rubber hose - pipe. It is simple in construction, is made of brass, packs into a small space, and weighs but 5 pounds. Price, complete, with three feet of rubber hose, discharge pipe, and two nozzles, for single stream and for spray or sprinkler, \$9.00. Thirteen subscribers at \$1.50 each, will secure the whole free, [or we will supply it on receipt of \$9.] Receiver to pay carriage or expressage in either case.

Premium 47.

Prem. 48

No. 48.—Self-adjusting, gold plate, Watch Key.—This Key is universally acknowledged by Practical Watchmakers to be the best ever offered to the trade. Several times, while on a summer trip in the country, we were able to accommodate friends, who had lost or mislaid their own watch keys, with one that would fit any watch, and it was one of these neat little things of Birch's invention. Each Key is thoroughly tested before being sold, and the whole is manufactured under the immediate supervision of the Patentee. Three subscribers, at \$1.50 each, will secure free the neat gold plate Key offered as Premium. For four subscribers, we will send free the more expensive style, celluloid, with gold-plated tips, retailed at \$1.50. Made by J. S. Birch, 38 Dey St., N. Y.—[Or we will send one, post-paid, for \$1.00; or the finer style for \$1.50.]

No. 49.—Pocket Tool Holder.—(See Engraving.)—Every boy (or man) will be glad to get hold of this Premium. We kept a similar, but less perfect set in use many years, and found it very convenient for a thousand little jobs. In a maple handle, which is hollow, with a ligum-vitæ head, are packed twenty small cast-steel tools, any one of which may be quickly adjusted to the handle. It will also hold for using, anything from an 8-inch mill-file to a cambric nee-

Premium 49

dle. Only 3 subscribers, at \$1.50 each, sent to us will secure you a free set, post-paid. These are made for us by the **MILLER'S FALLS MANUFACTURING Co.**, 74 Chambers St., N. Y.—[Or we will send one, pre-paid, for \$1.00.]

No. 50.—Houchin's Improved Patent Pocket Cook Stove.—With Gridiron and Boiler (with folding handles) holding nearly one quart, which can be used as a drinking cup. The cut represents the Stove in operation, with the boiler placed upon it, which will boil water in five minutes to make 2 or 3 cups of Tea, Coffee, or Chocolate; to Boil Eggs, Stew Oysters,

etc. Pour about two tablespoonsful of alcohol through the wire gauze, and light with a match or taper. The Lamp being filled with an indestructible packing will

Premium 50

not spill or explode. Send three subscribers, at \$1.50 each, and get it free, post-paid. These stoves are made by the **HOUCHIN MANUFACTURING Co.**, 150 East 169th St., New York.—[We will send one, pre-paid, for \$1.25.]

No. 51.—Payson's Indelible Ink, and Briggs' Marking-Pen Combination.—(See Engraving.)—Payson's Indelible Ink is too well known to need further commendation. It is almost indispensable in the family. Briggs' Marking-Pen has been before the public for fifteen years, and is justly celebrated for all kinds of marking, and particularly for writing upon coarse fabrics. The Pen and Ink bottle are put up in a neat box-wood case; the glass pen unjoints in the middle and fits inside the case. The whole is thus portable and always ready for use, and protected from injury by evaporation or breakage. We have used this pen and ink for several years with entire satisfaction. Presented, and sent post-paid, to any one who simply sends us 2 subscribers, at \$1.50 each.—[We will send a bottle of the Ink, with Pen, post-paid, on receipt of 75 cents.]

Premium 51

No. 52.—New Tubular Foot Lathes.—These are new First-rate Lathes, the smaller one about the size of a sewing machine table, and as convenient for the ingenious Man or Boy as the sewing machine is for women. It is made strong and durable, with many ingenious contrivances that adapt it to a great variety of work. With its attachments, it constitutes quite a Machine Shop; can be set in any room; the foot-gear on

balance-wheel does away with the need of steam or other power.—These Lathes are made of the best materials, the spindles, centres, and all working parts of steel; the bright parts nickel-plated, the other parts japanned, and are mounted upon strong and handsome stands, with black walnut tops; the stands for the smaller size are low, so that the operator can use them while seated.—They are artistic in design and will be an ornament to a sitting-room, while they are sold at as low prices as the poor articles usually found upon the market.—Not only is such a machine of practical use, but every boy and young man who has one, learns to become "handy," and whatever his occupation, he is ready to fix this thing and that, without running to a distant shop for any and every repair needed.—These Lathes are of three sizes: No. 1 is 17 inches long, swings 6 inches, price \$20.00. No. 2 is 24 inches long, swings 7 1/2 inches, price \$25.00. No. 3 is 31 inches long, swings 8 1/2 inches, price \$30.00.—No. 1 will be presented to any one sending 26 sub-

scribers at \$1.50 each; No. 2 for 31 subscribers, and No. 3 for 37 subscribers. Or any one will be supplied at the prices named above for each. They are made by the **USEFUL MACHINERY COMPANY**, No. 154 West 19th Street, New York, from whom free descriptive circulars may be obtained on application by postal card. *This is a splendid present to make to a Boy or Young Man, or to yourself, for the Holidays, or at any other time.*

No. 53.—Steinway Piano.—A Superb Gift.—SEVEN OCTAVE ROSEWOOD CASE; LARGE FRONT ROUND CORNERS; BEVELED TOP; OGEE Moulding; RICH CARVED LEGS AND LYRE; OVERSTRUNG PATENT DUPLEX SCALE; PATENT IRON CUPOLA AND PIER FRAME; PATENT AGRAFFE ARRANGEMENT THROUGHOUT THE ENTIRE SCALE, SAME AS IN GRAND PIANO.—This is one of the most elegant Premiums ever offered; regular and only price \$650. That this Magnificent Instrument comes from the celebrated establishment of MESSRS. STEINWAY & SONS, Nos. 109 & 111 East 14th St., N. Y., is enough to say; but it is due to these enterprising manufacturers to state that while their pianos have repeatedly received the FIRST PREMIUMS, by the award of the most competent judges the world can produce; at the Universal Exposition in Paris, they received the FIRST GRAND GOLD MEDAL, and at the Centennial Exhibition in Philadelphia, 1876, they were awarded the Highest Honors, viz.: TWO MEDALS OF HONOR AND TWO DIPLOMAS OF MERIT—no other Piano exhibitor having received a similar distinction. Official report on STEINWAY'S exhibit in the Main Building: "For greatest concert capacity in Grand Pianos, as also highest degree of excellence in all their styles of Pianos, viz.—largest volume, purity and duration of tone, and extraordinary carrying capacity with precision, and durability of mechanism; also, novel disposition of the strings and construction, and bracing of the metal frame." The report then minutely describes and emphatically endorses the six principal patented improvements which have made the Steinway THE STANDARD PIANOS OF THE WORLD. The world renowned Artists and Composers,

Premium 53

Dr. Franz Liszt and Anton Rubinstein, use the Steinway pianos exclusively, and pronounce them the standard pianos of the world. Many of the best judges in America say the same. We also speak from personal knowledge, as two of our Officers and many of our friends, who are good judges, have for years each had these pianos in use. This splendid Premium may be secured by many persons. Sending us 600 subscribers at \$1.50 each will do it. It may be done by securing the 600 subscribers at \$1.50 each, and save the entire cost, or by collecting the names at \$1 each, and paying the difference of \$300. [We will make a proportional allowance if half or more of the names are collected.] Many Ladies, and some Men, have secured this Premium, and some have obtained two or more, and sold the extra ones, thus securing large salaries. Classes of Young Ladies at school can unite in canvassing, and obtain a present for a Teacher, or a Piano for their school-room. We shall be glad to give this premium to a large number. Send to MESSRS. STEINWAY & SONS, New York City, for a free circular describing it.

No. 54.—"National" Organ.—The establishment of MESSRS. GEO. A. PRINCE & Co., Buffalo, N. Y., has long been famous for the excellence, durability, and elegance of the organs and melodeons manufactured there. We have had in constant use for sixteen years (part of the time in our Sunday School, and part of the time at home), one of Mr. Prince's Large Melodeons, piano case, and it is just as good to-day as ever, and we would not exchange it for any other kind. Mr. Prince has, however, gone on improving the instruments—"approaching greater perfection." No one can fail to be

pleased with these instruments. The "National" Organ, which we offer, is one of their latest and best styles, Price \$150, and it is claimed by the makers, that for power, quality of tone, style, finish, and the great variety of combina-

PRINCE'S "NATIONAL" ORGAN.

tions, of which it is susceptible, its equal has never been produced before. The organ has two full five-octave sets of reeds, and the Kent improved Vox Celeste Stop. It is an elegant premium.—Sent free for 150 subscribers, at \$1.50 each. Freight from manufactory to be paid by receiver.

No. 55.—Universal Clothes Wringer.—(See Engraving below.)—A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family.

Here is a thing that is of great value, "and no mistake about it." It will pay for itself several times a year, in any family. The wringing out of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibers with lever power. With this Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can

pick up the articles. A most important feature of this Universal Clothes Wringer is the peculiar cog-wheel arrangement, which makes both rollers turn together, and always keep their place. Without these, the crank-roller will slip, and pull the fibers, and injure the fabric. A multitude of letters of thanks for these Ma-

Premium 55

chines, given by us as Premiums, have been received. It is easy to gather at the regular rate of \$1.50 each, the 12 subscribers, and this will secure a present of one of these very valuable \$7.50 Universal Wringers. They are made by the METROPOLITAN WASHING MACHINE CO., Middlefield, Ct. R. C. BROWNING, 32 Cortlandt St., N. Y. [We will supply one of these valuable machines on receipt of the price, \$7.50.] Receiver to pay expressage.

No. 56.—Turn-table Apple Parer, Improved.—No. 57. Climax Apple Corer and Slicer.—No. 58. Family Cherry Stoner.—No. 59. Bay State Apple Paring and Slicing Machine. No. 60. "Saratoga" Potato Peeler and Slicer.—(See Engraving.)—All the above machines are most useful in every household where apples, cherries, and potatoes are to be cared for. Manufactured by the GOODSELL CO., Antrim, N. H. We have never seen the work for which these machines were contrived, more rapidly or better done, than they will do it. The Apples are pared, cored, and sliced with the greatest facility, and the Cherries are readily relieved of their stones, leaving the fruit in good shape. The "Bay State Parer and Slicer" has a new attachment to the Knife Head which cuts the Apple into slices, and places them at once side in a dish on the table. The "Saratoga" slices and peels the potato at one operation, and is a very ingenious and useful contrivance. Only three subscribers, at \$1.50 each, are required to get any one of the above, except No. 59, which requires four. For nine subscribers at \$1.50 each, we will send the whole (5) of them free, delivery unpaid. [Or we will supply any one of them at the price named (see Table).] Receiver to pay expressage. For prices see Premium Table, page 439.

Prem. 60

No. 61.—Moore's Floral Set.—This is a beautiful Premium—a complete set of Ladies' or Children's Garden Tools, for the cultivation of flowers, consisting of a Floral Hoe, Spade, Fork and Rake, (as shown in the engraving). They are made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly finished, and each set inclosed in a box. They will be found very convenient in the garden or greenhouse. They are useful, pleasing toys for the little folks, requiring only 3 subscribers, at \$1.50

Premium 61

each, to get them free. Better get more subscribers, and secure half a dozen sets or more, for others, to come with yours, as they can all come cheaply as freight. Made by the MOORE MANUFACTURING CO., Kensington, Conn. [We supply one set for \$1.00.] Receiver to pay expressage.

No. 62.—W. S. Blunt's "Universal Force Pump."—[Patented July 23, 1876.]—(See Engraving.)—What most country families need. An indoor Force Pump for 1¼ inch Suction Pipe; capacity 15 to 18 gallons per minute. These pumps are tested to 150 pounds pressure, and will throw water from a hose pipe 50 feet high, and 90 feet horizontally, and have revolving tops, so that they can be made right or left hand. Being operated by a side shaft entering through the air-chamber, there is no piston rod to wear out the brass stuffing box as in other pumps. They are among the most powerful, simple, and durable pumps to be had. The ease with which any part can be renewed in case of accident, or access had to the interior for repairs, commends them for UNIVERSAL FORCE PUMP—green-houses, farmers, and stockmen, as well as for city use. Send for a descriptive circular to THE NABON MANUFACTURING CO., 71 Beekman St., and 71 Fulton St., New York. We will send you this Pump free, for your own use, (or for sale at \$12.) if you simply procure us 18 subscribers, at \$1.50 each, which you can readily collect during a very few evenings or on rainy days. It will well repay the effort.—[We will supply this pump on receipt of the price, \$12.00.] Receiver to pay expressage.

Premium 62

Silver-Plated Ware—Swindling.

Next to returning *nothing* for one's money, there is hardly a greater fraud than that practised by some sellers of silver and gold-plated articles. With the aid of an electric battery, a piece of almost any metal put into a solution of silver can be so perfectly coated with the silver that nothing but pure silver can be seen, yet the coat may not be a thousandth part of the thickness of tissue

Premium 63

paper. Six pounds of lead, costing 30 or 35 cents, stamped into 100 Teaspoons of good form, can be perfectly coated with less than a dime of silver. The whole expense of labor, metals, chemicals, etc., may not exceed 75 or 80 cents, and thus there will be produced *good-looking* silver-plated Teaspoons at a cost of 5 cents a Set, or less than 1 cent each! And a vast amount of plated ware of *this character* is palmed off upon the country. The articles look well, until used a few times, when the *coating* disappears.—But properly managed, the electric process will put on a coat of pure silver of *any desired thickness*, and if the base metal be good, and the plating thick enough, such plated ware is just as good for practical use as if the whole were solid silver, while the cost is far less. Further, if after years of hard service the silver becomes worn off, the articles can be replated as good as new at a moderate expense. We have articles constantly used eight and ten years, and still showing nothing but silver. In buying silver-plated ware, *every thing depends upon the honesty of the manufacturer*, and the judgment of the buyer or seller.—We have taken great care in selecting articles to offer to our readers, to get not only those of *superior style*, but those which we can warrant to be *heavily plated*, and exactly as represented. Such articles as these are Premiums 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, described below. Our readers who get any of these, as Premiums, (or by purchase), may rely upon having first-rate articles, and as cheaply as they can be *honestly* made. They can find plenty of similar articles, at less than a fourth the prices named, and that will look as well for a few weeks, or months, if not used, but they will be *very dear*.—The Premiums Numbers 63 to 73 inclusive, are made for us by the MIDDLETOWN PLATE COMPANY, at Middletown, Conn. Mr. Judd is well acquainted with this Company and its Officers, and visits the extensive works frequently, observing the process of manufacture, and he confidently recommends their work as being *just what it professes to be*—and every way reliable. A similar commendation applies to Premiums 74, 75, 76, and 77, from the MERIDEN CUTLERY Co., whose work is first-rate.

No. 63.—Tea Set.—This is a **Splendid Set** of six pieces, full size, viz.: a Coffee Pot, a Tea Pot, a Water Pot, a Sugar Bowl, a Cream Cup, and a Slop Bowl—tasteful enough for the most stylish mansion—all beautiful, of uniform design, late pattern, with raised and embossed figure work. They are none of the common, cheap, silver-washed stuff that will look finely so long as unused, but are the *best triple-plated on white metal*. (See notes on plated ware, just above.) For all practical purposes, and for ornament, they will be as good as solid silver, for years. This No. 63 (and the others also), afford to a multitude of persons a rare opportunity to get *beautiful and useful* articles for home use and for wedding and other gifts. It will be comparatively easy to collect names of subscribers enough to secure one or more of these articles. In a few evenings a gentleman could easily get the 70 subscribers only, at \$1.50 each,

and secure this splendid \$60.00 Tea Set *free*, for his wife or a friend. Many a young man can thus get one for a mother, a sister, or *friend*. Any lady can get a Set for herself in a brief time. [We will forward one of these elegant sets on receipt of \$60.] Receiver to pay expressage.

No. 64.—Ice (or Water) Pitcher.—A large, highly Ornamental Article, that will adorn the table, as well as serve a very *useful* purpose, and last many

years, with no danger of breakage. Price \$13. It is same make, same metal, plating, etc., as No. 63. Send us only 18 subscribers, at \$1.50 each, and you will have this splendid Pitcher.—For 22 subscribers, at \$1.50 each, we will give the Pitcher with a **round Salver**, of pattern to correspond, (value \$17.50).—For 34 subscribers we will send the Pitcher and a large 14-inch **Ob-long Salver** (value \$28.00), which is large enough to hold the Pitcher and two goblets.—For 43 subscribers we will send the Pitcher, the **Ob-long Salver**, and a *pair* of beautiful **Goblets**, silver without, and gold-plated inside, (value \$34.75). This *Complete Set* is exceedingly desirable, though the Pitcher alone, or that with Round Tray, or with large Ohlong Salver, will answer well for *use and for ornament*.—[We will also supply the Pitcher, and any one or all the articles above mentioned, at the prices given for each.] Receiver to pay expressage.

No. 65.—Syrup Cup with Plate.—Every well set table needs at times a syrup cup. This elegant cup stands on a fine plate of suitable design.

Premium 64

Only 10 subscribers at \$1.50 each, are needed to secure it *free*. [Or, when desired, we will send one on receipt of the price, \$6.25.] Receiver to pay expressage.

Premium 65

Premium 66

No. 66.—Child's Cup.—(See Engraving).—A beautiful gift for the *Little One*. Triple-plated on the outside, and *gilded* on the inside. It never breaks, and will last for many years—indeed, be a *life-keepsake*. Obtain *only 7 subscribers*, at \$1.50 each, and you can secure one of these beautiful cups for your own child, or a name-sake, or other favorite.—[Or we will forward one on receipt of price, \$3.50.] Receiver to pay expressage.

No. 67.—Butter Cooler.—This is a really good and useful article, as well as an ornamental one. The pattern is very taking, having been selected from a

Premium 67

large assortment. A very little ice in the holder under the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The bright surface reflects off outside warmth, thus keeping the butter cool. Same metal, from same House as No. 63. This fine premium is *presented* to any one who simply collects and forwards us 10 subscribers, at \$1.50 each, easily done.—[Or we will send one to order on receipt of \$6.50.] Receiver to pay expressage.

No. 68.—Pickle Jar and Fork.—The jar is of glass, handsomely mounted in silver-plated frame, with fork attached. It is a very ornamental article for the table, as well as useful, and would prove an acceptable present to a young house-keeper. 8 subscriptions at \$1.50 each will secure it *free*. [Or we will forward one on receipt of \$5.] Receiver to pay expressage.

Prem. 68

Nos. 69, 70.—Cake Baskets.—Two styles are offered, both of *elegant* patterns, very taking, *useful*, and *beautiful* table ornaments—just the thing every one wants. From same makers and same metal as No. 63. No. 69 presented to any one sending only 12 subscribers, and No. 70 to any one sending 15 subscribers, at \$1.50 each.—[Or we will sell No. 69 for \$7.50, or No. 70 for \$10.] Receiver to pay expressage.

Nos. 71, 72, 73.—Casters.—These are all of *handsome* patterns, richly chased, No. 71 containing five cut glass bottles, including mustard, & the two others six, including a mustard bottle—*useful*, necessary, ornamental for every dining table. Same makers, and same metal and plating, as No. 63. Send us only 8 subscribers, at \$1.50 each, and get No. 71, or 12 and get No. 72, or 15 and get No. 73 *free*.—[Or we will sell No. 71 for \$5.25, No. 72 for \$7.50, or No. 73 for \$10.50.] Receiver to pay expressage.

Premium 73.

No. 74.—One Dozen Tea-Spoons.—No. 75.—One Dozen Table-Spoons.—These are all of the elegant *Crown pattern*, fine metal, *triple plated*, and for beauty of design, and excellence of workmanship, will be found unsurpassed by solid

silver. These spoons are far cheaper than many others we have found at half the price, and are well worth canvassing for. They are made by the MERIDEN CUTLERY CO., No. 49 Chambers St., N.Y. City. Eleven subscribers sent us at \$1.50 each will secure 12 Tea Spoons free; nineteen subscribers will secure 12 Table Spoons free.—[We will sell the Tea Spoons for \$7.25 per dozen, and the Table Spoons for \$14.50; or a set of six for half these prices.] Receiver to pay expressage. We will send a set of six Tea-spoons for 7 subscribers, or a set of six Table-spoons for 12 subscribers, at \$1.50 each.

No. 76.—One Dozen Table-Forks.—The same description and remarks apply to these as to No. 74, and they are from the same makers. (We select as Premiums only such articles as we can warrant in quality

Style of Prem. 74, 75, 76

and price, and these the most desirable.) Price \$14.50. Presented free to any one sending only 19 subscribers at \$1.50 each, or a set of six for 12 subscribers.—[We will sell one dozen for \$14.50, or a set of six for \$7.25.] Receiver to pay expressage, if not delivered at this office.

Premium 77

No. 77.—Child's Set; Knife, Fork, and Spoon.—The set is Standard Silver Plate, white metal base, medallion pattern, in satin-lined morocco case; an elegant present. Supplied by the MERIDEN CUTLERY CO. Six subscriptions at \$1.50 each will secure it free. [Or we will send a set on receipt of the regular price, \$3.00.] Receiver to pay express charges.

No. 78.—French Cook's Knife, Fork, and Steel.—This is a long (10 in.) thin Knife, with Celluloid or Patent Ivory Handle, warranted not to crack in hot water, made of the best steel and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match, and the fork is supplied with the very convenient patent rest. It would save many wry faces, and perhaps hard words, were it in general use. Supplied by the MERIDEN CUTLERY CO., 49 Chambers St., New York. Only 7 subscribers to the American Agri-

Premium 78

culturist at \$1.50 each, will secure the whole free. [We will send the set for \$3.75.] Receiver to pay expressage.

No. 79.—Case of Scissors.—The case is of morocco, handsomely gotten up, and lined with velvet and satin, containing three first quality scissors, crocus finish, length 4.5, and 5½ inches, respectively; a very pretty and useful Premium. Made by the UNITED

Premium 79

STATES STEEL SHEAR COMPANY, West Meriden, Ct., whose manufactures stand deservedly very high in the market. Furnished to us by the MERIDEN CUTLERY CO., 49 Chambers street, New York. Ladies can get this premium free, forwarded post-paid by mail, by sending a clink of only 7 subscribers, at \$1.50 each.—[Or we will send this set, pre-paid, on receipt of the price, \$4.00.]

No. 80.—Family Scales.—These scales, combining the advantages of counter and platform scales,

Premium 80

are peculiarly adapted to household purposes. (See Engraving.) They weigh from ½ ounce up to 240 lbs. They have a scoop, or pan, for weighing flour, sugar, or other house stores, and a platform for heavier articles, and are just such an apparatus as is needed for in-door or outdoor use, occupying less than 2 feet square. These scales are manufactured by the well-known FAIRBANKS & Co., No. 311 Broadway, New York, whose weighing apparatus has long ranked as the standard in all parts of the country. Send to them for circulars, if desired. Send us 19 subscribers, at \$1.50 each, and get these fine Scales free.—[We will also supply these scales on receipt of the price, \$14.00.] Receiver to pay the freight.

Nos. 81, 82.—Men's and Boys' Pure Gum Boots.—The "Candee" Pure Gum Boots (L. Candee & Co., New Haven, Conn.) are made with a view to great durability, and are claimed to be entirely free from the adulterative mixtures with which common rubber boots are cheapened. The heels are reinforced with the "Candee" Co.'s patent heel irons, which prevent the heels from wearing down, and therefore add to durability of the Boots. These Boots have also the "Candee" Co.'s patent outside straps, a great improvement over the old-fashioned inside web straps, which always curl up so as to prevent the quick insertion of the fingers. The Outside Strap, however, is quite handy, always ready for use, and perfectly durable. The "Candee" Pure Gum Boots are either varnished, or "Dull Finished." Experience shows that the dull finish boots are not quite so durable as those protected from the atmosphere and from the ammonia of barnyard-manures by a coat of varnish. Hence the manufacturers recommend the Varnished Pure Gum Boots, and warrant every pair to give reasonable satisfaction. We offer the Men's Size (Price \$4.35) for 8 subscribers, at \$1.50 each, or the Boys' Size (Price \$3.00) for 6 subscribers, at \$1.50 each. Carriage to be paid by receiver. In ordering these Premiums, state the size of the shoe you wear.

"CANDEE" PURE GUM BOOT.

Premium 83

No. 83.—Household Press.—This is one of the most convenient little inventions for the housekeeper that we have seen. It is for pressing corned beef, spiced meats, honed turkey and chicken, etc., etc. By an easy change of the bottom, the press can be used in making jellies, eider, or pressing out lard, tallow, herbs, or beef for tea for invalids, and in many other ways. Supplied by W. A. BOARDMAN, Medway, Mass. We will send one free for 4 subscribers at \$1.50 each, [or on receipt of the price, \$2.00.] Expressage to be paid by Receiver.

No. 84.—Matthews' Garden Seed Drill.—This is regarded as one of the most valuable implements in use. Medals and testimonials confirming its superiority have been repeatedly bestowed upon it. It is designed to be used either in field or garden. In operation, it opens the furrow, drops the seed accurately at the desired depth, covers it, and lightly rolls it, and at the same time marks the next row, all of which is done with mechanical precision, by simply pushing the drill forward. In this way it sows, with an evenness and rapidity impossible for the most skillful hand to do, all the different varieties of beet, carrot, onion, turnip, parsnip, sage, spinach, sorghum, peas, beans, broom corn, fodder corn, etc. The drill is complete in all its arrangements, and is very durable. There are no cams, gears, springs, or belts, to get out of order, nor are there any parts subject

to unusual wear, and, with fair usage, it will last many years, and do a vast amount of service, without requiring

any repairs. Made by EVERETT & SMALL, Boston, Mass. This fine implement sent free for 18 subscribers, at \$1.50 each. [We will sell one for \$12.] Receiver to pay carriage.

No. 85.—Cahoon's Broadcast Seed-Sower.—This Hand Seed-Sower sows from four to

Prem. 85

eight acres per hour, at a common walking gait, throwing wheat and rye from 30 to 36 feet wide; barley, 30 feet; hemp, 28 feet; oats, 23 feet; clover, Millet and Hungarian seed, 22 feet; and Timothy, 18 feet. Price, \$6. Presented to any sender of 9 subscribers for *Agriculturist*, at \$1.50 each. It is manufactured by the GOODELL CO., at Antrim, N. H.—[We will supply one on receipt of the price, \$6.] Receiver to pay express charges.

Nos. 86, 87.—Good Barometers are very Useful to Everybody, now. The recent improvement in weather observations enables one to readily know what the weather is likely to be many hours in advance, and such knowledge is of great value in caring for crops, animals, in planning work, etc.

No. 86.

To almost every farmer, and to many others, a good Barometer will every year pay a very large interest on \$100.—To meet this want, the Publishers have arranged to supply one of the most accurate, simple, desirable, and cheapest **Mercurial Barometers** to be found in the country—just as good for all practical purposes as one costing a hundred dollars, or more, viz.: **Woodruff's Patent Portable Barometer**, manufactured by Charles Wilder, Peterboro, N. H. We have tested Mr. Wilder's work for many years, and can confidently recommend the barometer to all. The Barometers offered are so portable that they can be sent to any distance safely. — *Description*: No. 86 is cased in finely finished, polished Black Walnut. Length, 3 feet; width of top and base, 4 inches; width of shaft, 2 inches; depth (thickness), 1½ inches, with pedestal, 2½ inches deep; mounted with metallic plates, Vernier scale, *Thermometer*, and index. Glass door over the face. Price reduced to \$12.—No. 87 is in neatly turned Case of maple or Cherry. Length, 40 inches; diameter of base and top, 2½ inches. Shaft slightly tapering, about 1½ inches in diameter. Semi-circular glass face; mounted with metallic plates, Vernier scale, and *Thermometer*. Price reduced to \$8.—These Barometers will be securely packed, and forwarded direct from the manufactory to any address. The cost of carriage, which will be small, to be paid by receiver.—We present No. 86 for 17 sub-

Premium 89—DEFIANCE SPRING WHEAT.

scribers, at \$1.50 each; or No. 87 for 12 subscribers.—(On receipt of price we will forward either barometer.) Send to Mr. Wilder for a full description of instruments.

Nos. 88, 89.—New Hybrid Spring Wheat.—After a careful trial of six years, Messrs. B. K. Bliss & Sons, who are known as one of the most reliable seed houses in New York City, offer to the public the two varieties of Spring Wheat, the **Champlain** and the **Defiance**, which we present as Premiums, feeling assured that they will be *valuable acquisitions* to the wheat-growers of the country. We have seen specimens of both varieties, raised in widely separated portions of the country, and they appear fully to sustain what is claimed for them. Premium No. 88, the **Champlain** Spring Wheat, was produced in 1870, by Mr. Pringle, in his endeavors to unite the remarkable hardiness of the Black Sea with the fine and superior quality of the Golden Drop. Several varieties were the result of this hybridization, from which this one was chosen, as realizing the end in view, showing greatly increased vigor and productiveness over both its parents. A careful selection from this for the past seven years has now fully established its character, and we have a wheat bearded like the Black Sea, with the white chaff of the Golden Drop, free from rust and smut, yielding a lighter-colored grain than the former, which makes a flour of *superior quality*. Its strong and vigorous straw, growing 6 to 12 inches higher than its parent varieties, stands erect, frequently bearing even in very ordinary culture heads from 5 to 6 inches in length, containing from 60 to 75 kernels each. We confidently recommend this new wheat as among the earliest, promising to give the grower of this most important crop better results than are produced by the old and "run out" varieties now sown. Four subscriptions, at \$1.50 each, will secure **three pounds** of this wheat, sent post-paid. Carefully cultivated, 3 lbs. will yield several bushels of seed for the next sowing.

Premium No. 89, the **Defiance**, is another variety of Spring Wheat of the highest promise, the result of a series of experiments by Mr. Pringle in 1871, to incorporate superior qualities upon the hardy stock of our common Club Wheat, by hybridizing it with one of the finest, whitest, and most extensively grown sorts of the Pacific Coast. This variety displays great productiveness, vigor, and hardiness. It is a beardless, white chaff wheat, with heads frequently 5 to 6 inches long, very closely set with large white kernels, frequently numbering 75 to 80 on the single head. Its white, stiff, erect straw, exempt from the attack of rust, its earliness, its

like a rifle. Is in a *neat mahogany case*, with 250 rounds of ammunition. Price, \$14. Manufactured by Messrs. J. STEVENS & Co., Chicopee Falls, Mass. Only 19 subscribers, at \$1.50 each, required to get it *free*. Or it will be forwarded on receipt of price, \$14. Without the mahogany case, we will give it, packed in a paste-board box, all complete, with 100 cartridges, on receipt of 18 subscribers, at \$1.50 each.—[We will sell this one for \$12.00]—Receiver to pay expressage.

No. 91.—Double-Barreled, Breech-Loading, Central Fire Shot-Gun—Remington's.—Steel barrels, using paper or brass cartridges, that can be reloaded many times; two dozen of which, and reloader, (costing \$4), and 500 primers, or caps (costing \$1), are given with the gun; one of the finest guns ever offered the American sportsman, combining all the most desirable features of the best imported, together with some valuable improvements not found

with any other. Just as good as many of those imported at a cost of \$150 to \$200 or more. 52 subscriptions at \$1.50 each will secure it *free*; or we will forward one by express or otherwise as directed, on receipt of price, \$45.

Nos. 92, 93, 94.—Long Range Creedmoor Rifles used by most of the successful competitors at the International, State, and other rifle-contests. A great desideratum for shooting one-third to

five-eighths of a mile or more, at game or otherwise. The Remingtons now make them at three prices. *The barrels, locks, etc., all of the same quality, and shooting equally well*—the differences being in the stocks and extra finish. All three have *vernier sight, wind gauge, and spirit level*. No. 92 has a "pistol grip" stock; No. 93 is without pistol grip; No. 94 has a military stock. Some prefer these: it is a good deal a matter of taste, the shooting and calibre of all being the same. 100 subscriptions at \$1.50 each, will secure No. 92, price \$100, *free*—Or 88 subscriptions at \$1.50 each, will secure No. 93 *free*, price \$80—Or 70 subscriptions at \$1.50 each, will secure No. 94 *free*, price \$60 (*with Spirit Level*); or we will forward any style, by express or otherwise, on receipt of the price named.

No. 95.—Single-Barrel, Breech-Loading Shot-Gun, No. 16 Gauge—Remington's.—Plainly made, but shoots just as well as the most costly carved and ornamented weapons. Can be loaded and fired 5 to 10 times a minute: cleaning-rod and loading-stick, accompany the gun. 22 subscribers at \$1.50 each will secure it *free*, carriage unpaid; or we will forward one by express or otherwise, on receipt of \$18.

No. 96.—Archery Goods. The Orange Judd Company have added to their business a "Department" for the supply of equipments for every kind of legitimate Field Exercise and Games. Among these are **Archery Goods**, and the following are a few that can be offered as premiums for subscriptions, *carriage*

½ doz. arrows will be added.—Fine Lancelwood Bow, 5 feet long, price \$2, for 4 subscriptions at \$1.50 each, and for 5 subscriptions ½ doz. arrows will be added.—Fine Lancelwood Bow, 6 feet long, price \$2.50, for 5 subscriptions at \$1.50 each, and for 6 subscriptions ½ doz. arrows will be added.

—Extra quality Self Lancelwood Bow, made to weight, 5 feet long, price \$3, for 6 subscriptions at \$1.50 each, and for 7 subscriptions ½ doz. arrows will be added. The same quality of Bow, 6 feet long, price \$4, for 7 subscriptions at \$1.50 each, and for 8 subscriptions ½ doz. arrows will be added.

[Send two three-cent postage stamps for our "Sportsman's Library" Catalogue, containing a full list of Archery Goods, Sportsman's Equipments, etc., and the outlines of nearly two hundred works. It is beautifully illustrated with nearly 100 Engravings of dogs, horses, birds, fish, and game generally.]

No. 97.—Canvas Gun Cover.—Extra

heavy water-proof canvas, lined with flannel, *Victoria shape*, with binding and handle. Price, \$1.50. Manufactured by THOMSON & SONS, 301 Broadway, N. Y. Four subscribers, at \$1.50 each, will secure this, sent prepaid.

No. 98.—Hunting Shoes.—Oil finished grain leather shoe or moccasin, made with broad heavy soles and spring heel hob nails on heel, laced in front with hooks (over English style water-tight tongue), thus secur-

ing perfect fit around the ankle, making an easy-fitting, water-tight, durable shoe, especially adapted for the use of hunters, infantry, and pedestrians generally. Price, \$7. Manufactured by THOMSON & SONS, 301

Broadway, New York. Ten subscriptions, at \$1.50 each will secure a pair of these Hunting Shoes. Carriage to be paid by receiver. Send shoemaker's measure with order.

great vigor and superior qualities, commend it to universal trial. [See engraving]. Four subscriptions, at \$1.50 each, will secure **three pounds** sent post-paid.

No. 90.—Breech-loading Pocket Rifle.—(See Engraving.)—This remarkable little fire arm weighs only eleven ounces, yet shoots with great accuracy and power from 30 to 100 yards, or more, and

can be loaded and fired five times a minute. It can be carried inside the vest, and is accompanied by an extension breech, and it may be used either as a pistol or

No. 99.—Dog Collar.—Combination slip and straight Collar, made of heavy bridle leather, with nickel-plated buckle, D's, and name plate. Impossible

for dogs to slip this collar, as it tightens with pulling, and loosens as soon as the strain is off. Price, \$1. Same makers as No. 97. Three subscriptions, at \$1.50 each, will secure this free and sent pre-paid.

No. 100.—The Great Dictionary.—WORCESTER'S LARGE PICTORIAL UNABRIDGED EDITION, containing 1854 three-column pages, with a multitude of illustrative engravings. (The work is a large quarto volume.) Most of the thoroughly educated men of the country consider this as by far the best Dictionary in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to a Cyclopaedia. The Dictionary can be called for at our office, or be sent anywhere by express or otherwise. It should be in every family. Let a multitude of Boys, and Young Men, each get 15 subscribers, at \$1.50 each, and each secure this invaluable work. A great many have done so in the past. It is worth trying for all winter; but you can get subscribers enough this month to obtain it free. It is published by Messrs. J. B. LIPPINCOTT & Co., Philadelphia.—[We will supply one of these Dictionaries for \$10.00.] Receiver to pay expressage.

Nos. 101 to 104.—A MOST VALUABLE COLLECTION, giving in 22 Large Volumes, a vast amount of most Useful and Practical Information, collected during 22 years by a great number of active, earnest, intelligent, practical Men and Women, and illustrated with many thousands of beautiful, pleasing, and instructive Engravings, that have cost nearly Two Hundred Thousand Dollars. These Volumes are alone a large and valuable Library, containing more varied information on all matters pertaining to the Household, the Garden, the Farm, and kindred Subjects, than can be found in books that would cost five times the price of these. Each of these 22 Volumes has a full Alphabetical Table of Contents, for readily referring to any article or subject in the Volume. The Volumes are newly printed, from the Original Electrotype Plates, from time to time as wanted. They are neatly bound in uniform style, with gilt title, etc.; they are very convenient, and finely adorn the Book-Case or Table. These Volumes cost \$2.30 each, sent pre-paid through by Mail or Express. Those obtaining less than the 22 Volumes, can select any Volumes desired from XVI to XXXVII.—See Table, page 439, for number of subscribers required to get one or more Volumes free.

Most Important Premiums of All.
Nos. 105 to 108.—BOOKS—Choice Books, for the Farm, the Garden, the Household, on Architecture, and Other Subjects. Premiums 105 to 107 are for specific amounts, which may be selected by the recipient from the list, that is frequently published in the advertising columns of the *American Agriculturist*,* in amounts of \$10, \$15, \$20, etc., as noted in the Table of Premiums. The Books will all be forwarded to the recipient paid through by Post or Express, to any place within the United States or Territories, and to the farthest point on our border, when to be sent out of the United States.—N. B.—Here is an opportunity, not only for individuals to obtain good books for themselves and families, free, but also for the Farmers of a neighborhood to unite their efforts in raising a club of subscribers, and through these premiums get an Agricultural Library for the general use of all. Let some enterprising, public-spirited farmer in every neighborhood start this matter, ask his neighbors to help make up a list, and thousands of snub Libraries will be established all over the country, which, with the copies of the *Agriculturist* thus scattered, will have a wonderful influence in developing thought, increasing intelligence and awakening inquiry, and the increased profit resulting will be beyond estimate.—Premium 108 does not limit the amount of books, but any one, sending 20 or more names, may select any Books from our advertised List to the amount of 10 cts. for each subscriber sent at \$1 a year; or 30 cts. for each name sent at \$1.20 a year; or 60 cts. worth for each name sent at \$1.50 a year. Premium 108 is only offered for clubs of 20 or more. The Books for all the Premiums, 105 to 108 inclusive, will be sent post-paid.

* Descriptive Book List sent free on application.

No. 109.—An Excellent Watch.—(Offer limited to Supply.) This remarkably good watch is a Stem-Winder, and Stem-Setter, needs no key, and no opening to admit dust or dampness. A dozen of them have been carried for weeks and months by Editors and employees in the *American Agriculturist* Office, with great satisfaction. The dial is clear, with second-hand, is covered with strong, flat crystal with the new beveled edges. The case is strong, good-looking, heavily plated with nickel, which is not easily distinguished from silver, while it is harder, and not tarnished like silver by gases or sulphur vapors from the skin. For looks and wear, for use, these cases are superior to pure silver.—The works are well made, as proved by the accuracy of the watch. The watch weighs 4 3/4 ounces. (For full description, see *American Agriculturist* for September 1878, page 354.) This watch will be presented to any one sending 16 subscribers, at \$1.50 a year, or 30 subscribers, at

\$1.25 a year. Or it will be sent on receipt of \$10. It will be packed in a strong wooden box. Expressage to be paid by receiver. N. B.—We retain the right to withdraw this premium at any time, if the supply fails. Those wishing to secure it positively, can send on the pay for the 16 subscribers (\$24), and receive the Watch now, and forward the subscribers as secured afterwards.

An Open Secret.
How can Valuable Premiums be given, with the New, Reduced Subscription Rates?

ANSWER:—Readers of the *American Agriculturist* are only asked to pay for the actual cost of making and mailing the paper to them—not all of that even. Some good advertisements (only) are inserted in the paper for the three-fold purpose, of furnishing reliable business information to the readers, of supplying the deficiency in the cost of the paper not met by subscription money, and for a reasonable business income to the proprietors.

Increased Circulation brings more advertising receipts. So the Publishers pay, out of the advertising receipts, premiums to those who assist in keeping up and increasing the number of subscribers.—More circulation also brings more readers to be benefited by the paper, and that, of course, is gratifying to the Editors.

Instead of Cash premiums, the Publishers arrange to supply good, useful, desirable articles, which they buy in large quantities, at the lowest wholesale cash rates, and pay for in part by advertising. In this way they can give much larger premiums than they could in cash, while the articles are just as valuable as money to those receiving them, even more so, as they are sure of being reliable.

DID IT PAY?—A True Story.
Thirty-five years ago, two brothers settled on adjoining farms, with equal advantage as to soil, markets, capital, etc. One of them subscribed for the *AMERICAN AGRICULTURIST*, and now and then bought a Book or two about his own business—the whole costing an average of \$6 a year. His boys read and thought about their work, became interested in and respected it, and were happy in their toil, because they had something to think about. They grew up intelligent, and settled as good, prosperous farmers, respected and influential.... The other brother (partly influenced by an economical wife) "couldn't afford papers and books" (he could afford 6 cents a day, or \$20 a year, for tobacco,

beer, etc.) His boys worked sullenly by day, and "sky-larked" at night; they despised and hated their work, which for them was only exercising brute force, with little mind applied. When old enough to escape parental restraint, they quit the farm, one for this, and another for that, and none of them have ever amounted to anything. He is himself a sullen, dispirited man. Six dollars a year, or even \$2 a year, would have made a wonderful difference—would have changed their whole course of life. Would it have paid?—Reader, choose the better way. Get your neighbors to join you, and secure some books for the use of all, through Premiums 105-108. (See 1st column.)

Everybody's Paper.
For City...Village...Country;
For Men...Women...Children;
THE
American Agriculturist,
so-called because started 37 years ago as a Rural Journal—(whence its name)—but it has been frequently extended, in size and scope, without change of name, until it is NOW a very Large ILLUSTRATED FAMILY JOURNAL.
A large force of the most intelligent, practical Men and Women, constantly furnish to its pages Useful Information, thoroughly Reliable and Highly Instructive. Beautifully Printed on fine, strong paper.
Each Volume Contains 600 to 700 Fine Original Engravings, which are Pleasing and Instructive.
The whole reading pages are packed with carefully prepared information on a great variety of subjects. Over \$20,000 a year are expended in preparing the matter for this Journal before it goes to the printer. The paper is full of Good Things.
No one can Read this Journal without getting many Useful Hints and Suggestions that will each in the end repay Many Times its Cost.
An Immense Circulation divides the cost of preparation, engraving, and general expense among so great a number, that this Journal is supplied at just about the cost of printing paper and mailing. Taking into account its size, beauty, and value, it is by far the Cheapest Journal in the World.

In English and German.—Now, as for 21 years past, the *American Agriculturist* is issued in separate English and German Editions, both similar, and each supplied at the same rates.

TERMS. (Reduced.) [ALL POST FREE.]
One (or 2) Subscribers One Year.... \$1.50 each.
Four Subscribers One Year, \$5, or \$1.25 each.
Single Numbers sent, postpaid, for 15 cents each.
Specimen numbers for examination sent, postpaid, for 10 cents each.... Subscriptions can begin at any time.
The Above Terms are for the United States and Territories, and British America. Add 14 cents extra per year for papers delivered by mail in N. Y. City, and for copies sent outside of the United States and British America, except to Africa, Brazil, British Honduras, the East Indies, and Mexico. For the last named five countries the extra charge is \$3.00 per year, to cover extra postage, and Single Numbers, 17 cents, post-paid.... Remittances, payable to Order of Orange Judd Company, may be sent in form of Checks or Drafts on N. Y. City Banks or Bankers; or P. O. Money Orders; or in Registered Letters, such letters to have the money enclosed in the presence of the Postmaster, and his receipt taken for it, and the postage and registering to be put on in stamps. Money remitted in any one of the above three methods is safe against loss.

ORANGE JUDD COMPANY, Publishers,
245 Broadway, New York.

CRANDALL'S

HAPPY FAMILY

Selected from the Four Quarters of the Globe!

FROM THE JUNGLE! THE PLAIN! THE MOUNTAIN! THE RIVER!

The Whole Company on Wheels!

A TRAVELING SHOW

Which is popular everywhere, both with Boys and Girls, for whom it was specially prepared, and with their fathers and mothers, and all other friends.

The fifteen Animals, with their Keeper, are well-made strong, durable, and wonderfully true to nature. They can be arranged in an endless variety of positions and combinations, producing the most varied and startling effects. When not in use, they can all be packed away in the box, which is neat and strong.

When the Wheels alone are adjusted, the owner has a nice Wagon; when the ornaments are placed in position, a beautiful Cage, or Traveling Show; and when the Animals are added to this, and set up as any wide-awake child can arrange them, the effect is *stupendous!*

Price \$2; Expressage to be paid by receiver.
For Sale by Toy Dealers generally.

Orange Judd Company,
SOLE GENERAL AGENTS,
245 Broadway, New York.

A Toy so complete, or so comprehensive of the wants and tastes of Childhood, as this, has never been offered. It is not only a "Happy Family" itself, but it carries the spirit of happiness into every family where it goes, filling the heart of its fortunate young possessor with delight.

The Keeper.

A New Acquaintance.

See Up!

Did You Speak?

Don't You Wish You Had Him?

This Tiger comes straight from Bengal. He was caught in a sort of girdle. He opens his jaws. And shows his great claws. This royal old Tiger of Bengal.

This is an old Bear to be dreaded. He is shaggy and fat. Not hungry, for all that. This famous old Bear to be dreaded.

And this is the Wolf always roving. That sometimes is dressed in sheep's clothing. He devours the lambs. And frightens their dams. Does this sneaking old Wolf frighten?

And this is the Greyhound so speedy. By his looks you might think he was needy. But although he is gaunt. He is for above most. This true worthy Greyhound so speedy.

And this is the Owl that is scared. His claws by all acrimin are feared. When the nightfall is nigh. This worthy Owl is scared.

OUT FOR A FROLIC. WHO LEFT THE BARS OPEN!

In Abyssinia there lived this Baboon; They caught him one day before noon. He will eat nuts or corn. From evening till morn. This voracious Abyssinian Baboon.

This Rhinoceros' home is Kaffraria. Who never was afraid of malaria. His hide is like leather. And he's fond of warm weather. This clumsy old beast of Kaffraria.

And this is the Goat of the village. The neighboring garden he'll pillage. He is rugged and tough. But he's a Chimpanzee. This inexpressible Goat of the village.

And this is the Lamb of tradition. He once into school gained admission. But he's a Chimpanzee. This frisky young Lamb of tradition.

Now, here's the "Beginning of Man." According to Darwin's new plan. As you every one can see. What about this "beginning of man?"

And this is the Rabbit so funny. The boys always nick-name him Bun. His tail it is short. And his ears they are not. This plump little Rabbit so funny.

This is the Lion so majestic. And close to your mamma you'd best stick. He is the King of the Beasts. And proud of their teeth. This terrible Lion majestic.

This is the old Panther of Puma. He is sharp-eyed and cruel, a rummy. So he killed all the sheep. When the old man was asleep. 'Twas not caught this presumptuous Puma.

And this is the Leopard so agile. He'll pounce upon anything fragile. If he whisks but his tail. The natives turn pale. At this beautiful Leopard so agile.

This beautiful young Kangaroo. Was imported expressly for you. His hind legs are strong. And uncommonly long. This singular young Kangaroo.

HOMES IN THE WEST.

To those who are looking in the West for new homes, the lands of the

Burlington & Missouri River Railroad IN NEBRASKA

offer special and peculiar advantages. The lands lie in south-eastern Nebraska, adjoining the State of Iowa, and for soil, sub-soil, climate, water privileges, and for grain growing and stock raising facilities have no equals in the West.

The sales of land made by this Company during the year 1878 are equal to the combined sales of all the other land grants put together. A vast tide of people from the Middle and Eastern States has poured into this region during the last five years, and form a large and important element of the population.

The titles are perfect, and the land passes to the purchaser free from every encumbrance.

Full particulars are given on application to the

Land Commissioner of the B. & M. R. R.,
at Burlington, Iowa, or Lincoln, Nebraska.

Either of the above books sent post-paid on receipt of the price.

ORANGE JUDD COMPANY, 245 Broadway, New York.

ANIMAL MEAL

For Fowls and Swine.

Made from Fresh Meat, Fresh Bones, and parched and carbonized grains, all reduced to a fine, sweet, highly nutritious meal. Fowls and Swine eat it greedily, and it is so concentrated, that four to eight quarts is a sufficient quantity to mix with a bushel of common meal or other food, and the mixture is fed as you would ordinarily feed common meal. It will make your Hens lay and Pigs grow, the meat and parched grains being very stimulating and healthful, while the lime of the bone is essential for forming the shell of the egg or new bone in the growing pigs. It has been extensively used for five years. Trial Bags, containing 15 lbs., 50 cents; 30 lbs., \$1.00; 100 lbs., \$2.50.—Also for sale Ground Oyster Shells, Chicken Bone, Cattle Bone, Ground Scraps, Wheat Screenings, and a full line of Special Feeds for Poultry, Swine, and Cattle. Send for Price Lists and Circulars, giving full particulars, mailed free.

W. S. BLUNT'S UNIVERSAL FORCE PUMPS.

Secured by letters patent.

These pumps have enormous power, and are for the house or for out-door wells of any depth. They are constructed with special regard to strength, ease of working, and durability. They can be immediately changed from lift to force pumps, and the air chamber can be revolved, so as to allow the handle to work at any desired angle with the spout. Having close tops, they cannot be tampered with. Attention is called to our new elegant pattern DEEP WELL non-freezing FIRE PUMP. Also, Blunt's Sand Vacuum Chambers.—A complete protection against sand or gritty water in dug or driven wells, pits, mines, and rivers. For hand or steam pumps, all sizes, from 1 1/4-inch to 4-inch suction pipe.

THE DRIVEN WELL.

Town and County privileges for making Driven Wells and selling Licenses under the established American Driven Well Patent, leased by the year to responsible parties, by

WM. D. ANDREWS & BRO.,
NEW YORK.

It aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to have really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge, Dinah Mulloch Craik,
James T. Fields, J. G. Whittier,
Rebecca H. Davis, Louise C. Moulton,
Charlotte Mary Yonge, C. A. Stevens,
Edward Everett Hale, Harriet P. Spofford,
Rose Terry Cooke, A. T. D. Whitney,
Louise M. Alcott.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure, Stories of Home and
Letters of Travel, School Life,
Editorials upon Current Topics, Tales, Poetry,
Articles on Health, Selections for Declamation,
Biographical Sketches, Anecdotes, Puzzles,
Religious Articles, Sports and Pastimes.

Subscription Price, \$1.75. Specimen copies sent free. Please mention in what paper you saw this advertisement.

Terms—Publishers' Notices, etc.

For One or Two Subscriptions, One Year, the price will hereafter be (post-free) \$1.50 each, instead of \$1.60.

[ALL POST FREE.]

Three Subscribers one year.....\$1, or \$1.33 each.
Four Subscribers one year.....\$5, or \$1.25 each.
Five Subscribers one year.....\$6, or \$1.20 each.
Six Subscribers one year.....\$7, or \$1.17 each.
Seven Subscribers one year.....\$8, or \$1.14 each.
Eight Subscribers one year.....\$9, or \$1.12 each.

Ten or more Subscribers, post-free,
Only \$1 each.

[A free copy to sender of club of 20 at \$1 each.]

Single Numbers sent, postpaid, for 15 cents each. Specimen numbers for examination sent, postpaid, for 10 cents each. Subscriptions can begin at any time.

The Above Terms are for the United States and Territories, and British America. Add 14 cents extra per year for papers delivered by mail in N. Y. City, and for copies sent outside of the United States and British America, except to Africa, Brazil, British Honduras, the East Indies, and Mexico. For the last named five countries the extra charge is 38 cts. per year, to cover extra postage, and Single Numbers, 17 cts. post-paid. Remittances, payable to Order of Orange Judd Company, may be sent in form of Checks or Drafts on N. Y. City Banks or Bankers; or P. O. Money Orders; or in Registered Letters, such letters to have the money enclosed in the presence of the Postmaster, and his receipt taken for it, and the postage and registering to be put on in stamps. Money remitted in any one of the above three methods is safe against loss. Bound Volumes from Vol. 16 to 36 inclusive, supplied at \$2 each, or \$2.30 if to be sent by mail. Sets of numbers sent to the office will be bound in our regular style for 75 cents (30 cents extra if to be returned by mail). Missing numbers in such volumes supplied at 10 cents each.—Any Numbers of the paper issued for 21 years past, sent post paid for 15 cents each; or any full year, sent unbound, for \$1.50. Clubs of Subscribers can be increased at any time, at the club rates, if new members begin at same date as the original club.

Will Our Friends PLEASE OBLIGE US TO-DAY?

[When subscription letters arrive, one of the Proprietors opens them, carefully examines the enclosures, marks on each the amount enclosed, numbers each letter, puts the same number upon the checks, money orders, or other documents, and files the letter. Our most experienced careful clerks afterward examine the letters thoroughly, see exactly what is desired, enter the names in the Register for the day, with the letter number against each, the amount paid, the time paid for, each sender's name, gives him credit in another book for any names designed for a premium, etc., etc., and these letters are then filed away by number for reference, years after if need be. The Register Book of to-day (there is one for each week day) is on the next day taken by another clerk, who distributes the names through the State Mail Books, where they are arranged under the several Post Offices, and these are Indexed Alphabetically. Other clerks take these mail books and write wrappers for mailing the papers. Sundry checks are provided for ascertaining that every name and the amount paid, the time, etc., shall be entered. When we know a subscriber's P. O. and State, it is at once found from the Alphabetical Index, and then traced by page numbers, and letter numbers, to the Register Book, and, if necessary, to the original letter. When wrappers are written they are counted for each P. O. and called over and checked, to prevent any omissions. If any papers are lost, it is during transmission or delivery in the mail. All this system is convenient, even necessary to prevent any errors.]

NOW THEN,

the above indicates the amount of work required to enter 80,000 to 100,000 names, and get the papers on the way all right and promptly; and why we desire to have the work done by experienced, tried clerks, without the aid of extra men about Jan. 1st. It will Oblige us Greatly if as many as possible of our Readers will to-day (that is, when this paper comes to hand), send in their own renewals, and the names of the new friends who will come with them to enjoy, and be profited, we trust, by what we shall set before them during the coming year. Our plans are large; we are sure that these pages will give many items of information which it will pay every reader to have.

N. B.—At the bottom of page 488 will be found a convenient form for use in remitting subscriptions. It can be cut off without marring the rest of the paper, and will save the trouble of writing a formal letter. Our printing paper is sized and calendered the same as writing paper, so that it will carry ink writing.

The Holidays are Coming, and a good many can cheaply obtain fine articles, to surprise their friends with, by collecting a few names of subscribers, and forwarding them in ample time to have the premium article on hand before Christmas or New Year's. The earlier it is done now, the better, before the rush upon manufacturers and dealers, and the crowd upon the express and freight lines, may chance to cause any vexatious delays.

Pleasant Announcement.

A Magnificent Steel Plate, Line
ENGRAVING,MARSHALL'S GREAT WORK,
THE

Farmer's Pride,

For Every Subscriber to

American Agriculturist for 1879.

Fine Pictures add greatly to the attractiveness and cheerfulness of every home, however lowly it may be. More than 250,000 excellent Chromos, almost equal to Oil Paintings, such as the "Strawberry Girl," "Mischief Brewing," etc., now adorn the dwellings of the readers of the *American Agriculturist*, to whom they were sent exclusively. These are vastly superior to the cheap, dauby pictures subsequently scattered through the country, and which led us to cease distributing Chromos altogether.

We are happy to announce, however, that we have now completed arrangements for supplying all the bona-fide subscribers of the *American Agriculturist* for 1879 with Marshall's *Superb Steel Plate, Line Engraving*, entitled "THE FARMER'S PRIDE." Mr. Marshall's great portraits of Washington, Lincoln, and others, have achieved for him a WORLD WIDE REPUTATION.

The eminent French artist, Gustave Doré, styles him "the Master of Art in America," and European critics have united in pronouncing his portrait of Mr. Lincoln the *finest specimen of lineal art produced in this century*. Mr. Marshall regards this last work, "The Farmer's Pride," equal to any of his previous efforts, and it will unquestionably be so regarded by judges. The cost for engraving a steel plate ranges from One Hundred Dollars upward, according to the artistic execution, fineness, and size. Mr. Marshall receives

Three Thousand Dollars

for engraving this picture, which of itself indicates the excellence and value of the work.

The usual price of steel-plate line engravings of the size and character of "The Farmer's Pride," is **Ten Dollars**. To other than subscribers, we will supply the picture, postage prepaid, for **Five Dollars**. To all bona-fide subscribers of the *American Agriculturist* for 1879, however, we will supply the picture at our office, together with the Paper, one year, post-paid, for **\$1.63**, or **\$1.70** when the picture is forwarded by mail, securely rolled and protected in a mailing-tube, free of any extra charge.

That is to say, we will send the *American Agriculturist* for 1879 to bona-fide subscribers, together with Marshall's elegant Steel Plate, Line Engraving, "The Farmer's Pride" (price \$5.00), for **\$1.70**, all postage prepaid.

OR,

When the engraving is delivered at our office, 245 Broadway, we will furnish the paper and the engraving for **\$1.63**, postage for the year prepaid on the paper. We make this

EXTRAORDINARY OFFER,

because of our desire to place this beautiful picture in the homes of all our subscribers, and at the

same time to increase the number of these subscribers for 1879 to a round

TWO HUNDRED THOUSAND.

We are enabled to afford our readers this unparalleled opportunity for obtaining a master work of art, through our having sole possession of the plate, and our unequalled facilities for issuing the large number required.

Though the *American Agriculturist* at the reduced price (\$1.50 per annum), is cheaper than any similar journal in the world, and richly worth treble the price of the subscription, we cheerfully supply this magnificent engraving at a great expense to ourselves, believing that we shall be recompensed for so doing in the satisfaction afforded, and in the increased interest and efforts for the paper, of those subscribers who share in the distribution.

"THE FARMER'S PRIDE"

is executed in the highest style of art on fine plate-paper, Twenty-Two Inches by Twenty-Eight Inches. Some idea of the estimation in which the artist and the picture are held, may be had from the fact that thirty artist proofs of the engraving we offer, with the signature of the Artist, have been subscribed for at **Twenty-five Dollars each**.

RECAPITULATION.

The *American Agriculturist* for 1879 postage prepaid, (14c. extra in New York City). **\$1.50**

"The FARMER'S PRIDE" to other than Subscribers (postage prepaid)..... **\$5.00**

The *American Agriculturist* and "THE FARMER'S PRIDE" to one address, (postage prepaid on both)..... **\$1.70**

The two, when the picture is delivered at our office, 245 Broadway,..... **\$1.63**

No person other than a Subscriber can procure this picture at less than \$5.00. It is now on exhibition at the reception rooms of the *American Agriculturist*, 245 Broadway.

The Engravings will be issued as rapidly as possible, and subscribers will be supplied in the order of their application.

The Steel-Plate to Subscribers in Clubs.

To accommodate our subscribers who have already sent in their names in clubs, at club rates, and those who may hereafter do so, we subjoin the following offers:

Four Subscribers for 1879, and Four Engravings, all post-paid, for..... **\$5.80**

Six Subscribers for 1879, and Six Engravings, all post-paid, for..... **8.20**

Ten Subscribers for 1879, and Ten Engravings, all post-paid, for..... **12.00**

To Clubs of Ten Subscribers, post-paid, and Ten Engravings taken at the Office, or forwarded by Express in one package, expressage unpaid..... **\$11.80**

Clubs above Ten at the same proportionate rates.

The Steel-Plate Engravings for

Premium Clubs.—The above offer of Engravings will in no way interfere with the General Premium List, but all subscribers, from whatever source received, will have equal privileges. For particulars, see page 481.

A NEW PREMIUM—Or a Pocket Revolver, Cheap.

—So many write us for good, low-priced revolvers, that we have arranged to supply those who specially want them, thus: 1st—A very good, steel-barrel and lock, nickel-plated, 7-shooter Revolver, Calibre 22-100. Made at the celebrated Remington Arms Works, weight 7 ounces. It is as good as any made for anything like the money, and good enough for anybody who wants such an implement. We have just fired one 100 times, and found it work very well. It will be sent free to any part of the United States, post-paid, by mail, to any one sending only 5 subscribers to the *American Agriculturist*, at \$1.50 a year, or 10 subscribers at the 4-club rate of \$1.25 a year. [Or it will be delivered free as above, on receipt of \$2.50. It is as good for use as any \$5 or \$10 revolver of like calibre.] 2d.—A larger 5-shooter Revolver, nickel-plated, calibre 32-100, weight

11 ounces will be presented for 7 subscribers, at \$1.50 each, or 12 at \$1.25 each, delivered free, as above. [Or it will be forwarded free, as above, on receipt of \$4.]

A PREMIUM AVAILABLE
to Nearly Every Subscriber.

Except in some small places, where nearly everybody already takes this paper, there are very few of our readers who do not each know at least two others who would be profited by the perusal of such a paper, and who would take it if its merits were explained to them. The Table, page 481, names 20 desirable articles, one of which will be presented to any one sending his own and two other subscriptions at \$1.50 each a year. It is very easy for a multitude of people to each make up a larger list and get a more costly Premium. The articles are described and illustrated in the November number. A separate Illustrated Descriptive Sheet will be sent to any one desiring it.

An Important Enterprise Proposed.

The Best Possible Investment of a small sum that can be made by the farmers of any neighborhood, is to secure a few good books, and pass them around from one to another during this and the next three months, until all have read them. We firmly believe that \$10 to \$20 thus invested, amounting to but a trifle each, if a considerable number unite, will, in the end, be worth many hundreds, if not thousands of dollars, to that neighborhood. It only needs some public-spirited man, young or old, to take hold as a leader in the enterprise, and it will be quickly consummated.—Better still, to unite in forming a club of subscribers large enough to secure a number of volumes free. Thus: Fifteen persons clubbing together and paying only \$1.50 apiece, will not only each have the *American Agriculturist* post-paid for a year, but they will also receive, delivered free, **\$10.00** worth of good books, which all can read in turn. Twenty persons get **\$15.00** worth of books; Twenty-six persons thus uniting, will get **\$20.00** worth of books, or quite a library. By this arrangement, each member of the club will, by the payment of \$1.50, not only have the paper all the year, but a joint ownership in \$20.00 worth of valuable books, and a perpetual right to use them. One of the club may be appointed as keeper, or librarian, to take charge of the books, and give them out as desired. There ought to be 50,000 such library clubs in as many different neighborhoods, this very winter, this month even. Who will be the first enterprising, public-spirited man in each place to start such an enterprise?—Here are some

BOOKS TO SELECT FROM.—These may be of many kinds for the above. We suggest the following as making up a good assortment to start with: Allen's New American Farm Book, \$2.50; Barry's Fruit Garden, \$2.50; Henderson's Gardening for Profit, \$1.50; Stewart's Irrigation, \$1.50; Thomas' Farm Implements, 1.50; Tim. Bunkers' Papers, or Yankee Farming, \$1.50; Johnson's Winter Greenhouses at Home, \$1.00; Dadd's American Reformed Horse Book, \$2.50, or, Dadd's Horse Doctor, \$1.50; Herbert's Hints to Horse-Keepers, \$1.75; The Percheron Horse, \$1.00; Coburn's Swine Husbandry, \$1.75; Harris on the Pig, \$1.50; Dadd's Cattle Doctor, \$1.50; Stewart's Shepherd's Manual, \$1.50; Wright's Practical Poultry-Keeper, \$2.00; Reed's House-Plans for Everybody, \$1.50; Harris's Talks on Manures, \$1.50; Quinby's Mysteries of Bee-Keeping, \$1.50. All the above books would cost only \$30.00, if purchased, or nothing but a little effort, if obtained by a club; but any portion of them can be used in the start, and there are many others that may be preferred for a particular purpose in any locality.

A "Baker's Dozen" for 10 Days.—To all new subscribers for 1879, received prior to December 10, we will send this number without extra charge; this is 13 months for the price of 12.

Clubs can at any time be increased by remitting for each addition, the price paid by the original members: or a small club may be made a larger one at reduced rates, thus: One having sent 6 subscribers and \$7, may afterwards send 4 names more and \$3, making 10 subscribers for \$10.00; and so for the various other club rates.

American AGRICULTURIST.

NEW YORK, DECEMBER, 1878.

The Texas Cattle Drive.

Ogalalla, Nebraska, the terminus of the Texas Cattle Drive, is located on the Union Pacific Railroad, 342 miles west of Omaha. The place has figured considerably in the newspapers during the autumn, as being the point where the Cheyenne Indians (escaping from the reservation in the Indian Territory) crossed the South Platte River and ultimately secured their freedom. The first house at Ogalalla was built in 1870, and though there are now not more than twenty buildings, all told, the place, during the cattle season, is full of bustle and excitement. The first drove of cattle from Texas reached here in 1874. Prior to that time they were driven to Fort Kearney, 154 miles further east on the

ing it. The cattle brought from the southern portion of Texas, travel some seventeen hundred miles, and those from the northern part of that State, about thirteen hundred miles. It takes an even five months to make the journey from the southern part of Texas, and from three and one-half to four months for that from the northern part of the State. There have been cases of forced driving, where the cattle have come through in ninety days. A forced drive is made when the owner of the herd finds a better market at Ogalalla than he anticipated, and sells more cattle than he has ordered to come up; in such a case he orders, through his agent in Northern Texas, a fresh lot to come on as quickly as possible. The proprietors or principals generally buy the cattle in Texas on time, paying from \$3.00 to \$4.00 a head, down; they receive cash for them at Ogalalla, and settle up with the original owners when they return to Texas. They purchase in Texas a cow, for example, for \$8.00, and the calf is thrown in; the animals are kept on pasture lands, at little or no expense, until spring, when the herd is made up for the north. Upon reaching Ogalalla the cow brings \$12.00 and

ble portion of their wages with the Spanish Monte and Faro dealers. It very frequently happens that they do not have enough money left to pay their way back to Texas by ears, and are therefore compelled to mortgage their next season's wages! After reaching the extended valley of the Platte, opposite Ogalalla, the cattle, while waiting to be sold and delivered on the north bank of the river, graze up and down the south side of the Platte over an area forty miles long and from one and a half to four miles wide. At one time this year (July 21st) there were fifty-five thousand head of cattle grazing in this valley. There is a space left between the herds a quarter of a mile or more wide, which the cow-boys utilize for camping purposes, they remaining on this side of the Platte until the cattle are sold. Calves born on the road are invariably shot, and mothers are generally roped with steers or cows that have not calved, for if this were not done they would manage to slip away in the night and return to the spot where their offspring were shot. Buyers who live a long distance away, shoot the calves born at Ogalalla, as they do not care to drive them over the long distance to their ranches.

VIEW OF OGALALLA, ON THE PLATTE RIVER, NEBRASKA, THE TERMINUS OF THE TEXAS CATTLE DRIVE.

Union Pacific Railroad. As the country around Kearney became settled, a new terminus had to be selected, and Ogalalla was decided upon because of its geographical advantages. The cattle could no longer be driven to any point eastward without encountering improved lands, and it was not feasible to drive them to any point west of Ogalalla, owing to the difficulty they would experience in procuring water en route. Between Ogalalla and Buffalo Station, on the Kansas and Pacific Road, from which point the cattle drive leads northward, there are nearly a dozen streams or rivers about far enough apart to make convenient watering stations for the cattle. These streams embrace the Saline, South Fork of the Solomon, Prairie-dog, South Sappa, North Sappa, Beaver Creek, Driftwood, Republican, Freuchman, and the White Men's Fork. The distance between these rivers is about twelve miles, which is a fair day's drive, but the distance from the last river to Ogalalla, on the Platte, is about thirty miles. On account of absence of water between the latter points, the drive is generally made in the cool of the day, or in the nighttime, the cattle being watered at the last moment before they are started on this long drive to the South Platte. The whole distance from Buffalo Station to Ogalalla is 145 miles, and about twelve days are usually consumed in mak-

ing the calf from \$7.00 to \$8.00. Owners rarely accompany their stock, but reach Ogalalla by railroad several weeks before the cattle arrive, in order to make bargains, etc. Thus the owners frequently have their herds sold before their arrival.

The herds leave Texas in the early part of February, generally numbering from one thousand to thirty-five hundred head of cattle, and requiring from eight to ten men to manage them. These herders receive \$30.00 a month, and also \$50.00 extra upon reaching Ogalalla to defray their expenses back to Texas. There is a head herder, who exercises authority over the others, and who is universally known as the "Corporell." Mess wagons for the herders are fitted out by the proprietors. They generally take with them from thirty to forty horses, to meet the wants of the long drive, and often purchase or trade for others on speculation *en route*, to be sold at an advance at Ogalalla. All the horses are sold when the cattle are delivered at the end of the drive. As fast as the owner disposes of the cattle, and the cow-boys can be spared, he pays them off, when they at once proceed to indulge in what they term "a little amusement." The sharpers and gamblers who have reached Ogalalla from various points, are always ready to accommodate the cow-boys in their search for "amusement," and they are fortunate if they do not leave a considera-

The cattle go to the river for water at noon, with the exception of a few which remain behind to take care of the calves. One cow may often be seen watching twelve or fifteen calves, while their mothers have gone with the remainder of the herd to drink. After the return of the herd the "watchers" take their turn. This interesting fact is vouched for by several old ranchmen.

In 1874, the first year that Ogalalla was made the terminus of the drive, fifty thousand head of cattle reached here. Last year, 1877, eighty thousand arrived. The number of cattle brought here this year and distributed to the ranchmen, is computed at one hundred and twenty thousand. The herds begin to come in about the first of May, and continue to arrive until September. During the present season, the cash prices here have been about as follows: Yearling heifers, \$8; yearling old steers, \$9; two-year old heifers, \$11; two-year old steers, \$13; cows, \$12; three-year old steers, \$16; calves, \$19 to \$20.

After the ranchmen have kept the cattle on their northern ranges for a year or more, they ship them to the Chicago market and make their profit on them. The principal cattlemen engaged in the Texas cattle drive are: Ellison & Dewese, D. R. Fant, Seth Mabry, Captain Littlefield, Millett Bros., and W. G. Butler. There are smaller dealers, making together about twenty-five. Mr. Ellison, who

remains at Ogalalla much of the time, has been the principal dealer or "middle-man," as the bulk of the trade has passed through his hands. The ranchmen have obtained from him any kind of cattle they have desired, and he in turn has purchased of the other dealers, so that the latter may be said to have done their business through him. Major Mabry has likewise done a good deal of business of this kind. There is another Texas drive, that to Fort Dodge on the Atchison, Topeka, and Santa Fe R. R., several hundred miles south of here. Of course it would be a great saving of distance and expense if the proprietors could stop at Fort Dodge, rather than bring their cattle on up to Ogalalla. But they can not find so ready a market for them at Fort Dodge as at Ogalalla, which is easily accessible to the owners of the great cattle ranches in Wyoming, Nebraska, Colorado, etc. It is computed that about seventy thousand cattle were driven to Fort Dodge the present year, and of this number, some twenty thousand remained unsold, and were brought on up to Ogalalla, where they found purchasers. Ogalalla, in addition to being the terminus of the Texas cattle drive, is likewise a shipping point for cattle going to Chicago. After the drive terminates (about the first of September), the shipping business begins, and continues to the first of November. The average expense of getting cattle from Ogalalla to Chicago is \$7.00 per head, which includes railroad charges, yardage, and commission. If the Chicago market is any way satisfactory, the ranchman is able to realize a very fair profit over and above the rice originally paid to the Texan proprietor, and the little expense of maintaining the cattle on his ranch for a year or more. There were about thirteen thousand head of cattle shipped from here to Chicago last year, and the shipments this year will reach eighteen thousand. Julesburg, about 35 miles further west, on the Union Pacific R. R., is another important shipping point. Twenty-two thousand head of cattle were forwarded from there last year. It is computed that the shipments this year will amount to between thirty and forty thousand head. The Iliff Estate, which has been run by contract since the death of Mr. Iliff, by the Snyder Bros., will alone ship over fourteen thousand from Julesburg this year. Some idea of the magnitude of the Iliff shipments may be obtained from the fact that the estate forwards three train loads per week of twenty cars each, and fourteen weeks will be required to complete the shipments. There was a large shipment this year from Cheyenne, about 13 miles west of Julesburg, which is also another important shipping point. The largest shippers this year from Cheyenne have been the Swan Bros., who own in the neighborhood of a dozen different ranches, and who, it is thought, aim to succeed the late Mr. Iliff, as the Cattle Kings of the North West.

Hints for Work.

[The Hints and Suggestions in these columns are never copied from previous years, but are freshly prepared for every month, from the latest experience and observations, by practical men in each department.]

There is more room for thought in the business of farming now, than ever before. There is more money employed in the business, more machinery is used, and a greater diversity, and a better quality of product is demanded by the consumer.

Plans for management may be discussed in the family, and in gatherings of neighbors. By talking over such matters, and getting the ideas of people of experience, the best, most convenient, and most profitable methods are often found.

Feeding Stock.—Economy and effectiveness, are the main points to observe. The best food, fed in the best way to the best stock, must be the most profitable, and to reach this conclusion is more a matter of care and skill, than of money. Money can procure food, stock, good buildings, and labor; but good management always depends on the intelligent application of known facts to practice.

Making Manure is next in importance to feeding stock. This subject is worthy of careful study, and

every farmer may look to Joseph Harris' new book "Talks on Manures," for many valuable ideas. He will find gathered in it not only the author's practical knowledge, but the pith of most that has been learned and printed on the subject.

Saving Fodder.—There are many fields still dotted with shocks of corn fodder. This season it ripened very thoroughly, and needed but little drying to cure it. It may be safely stacked or stored in barracks this year with less precaution than usual, but to prevent further waste, the stover should be taken care of as soon as possible.

Roots yet unharvested, should be taken up at once, before the frozen ground prevents. Pits not fully protected, should now be made safe by an extra coating of straw and earth. With a foot of straw, 3 inches of earth will be sufficient.

Cabbages are coming into common use as fodder. They may be saved by pitting them in heaps of two or three wagon loads, with sheaves of straw intermingled, and covering with straw and earth, as for roots; or by placing them, roots upturned, upon the ground, in a dry place, and throwing a few inches of earth over the heads. We find that cabbages make excellent food for milking cows.

Turnips may be fed to milking cows, without danger of flavoring the milk disagreeably, by giving them immediately after milking. A root cutter, or some other method of reducing the roots to thin slices or pulp, is worth the cost as a preventive of choking, if for nothing else. A few cut turnips or carrots occasionally are beneficial to horses.

Live Stock require constant watchfulness. To keep them comfortable is as important as to feed them well. No animal will thrive and fatten, if unclean and cold, hence uncomfortable and fretful.

Warmth saves feed, helps fattening, and often prevents sickness, if not the total loss of an animal.

To keep the animals in good condition, or increasing in weight, should be the object of every farmer during the winter season. To permit a loss of weight after the summer's feeding, is to waste the food both winter and summer. It costs more to get an animal fat, than to keep it fat.

Young Animals require particular care; this is the making of the adult animal. To over feed is as unwise as to stint food. Costiveness is perhaps the most to be guarded against at this season; linseed oil-cake meal is a good and cheap preventive. One pint to one quart daily may be given.

Horses at regular work, should be kept in good condition. Two quarts of corn and oat meal, added to a bushel of cut straw, will make it equal to so much hay. This will make a sufficient ration for an idle horse; for a working horse, add 3 quarts of this meal, or 3 quarts of oats at each feed.

Working Oxen are often more useful than horses, and of late have been too much neglected. It should not be forgotten that oxen require more time to feed than horses, and ample opportunity for rumination should be given. During winter, oxen that work upon the road ought to be shod. The cost will be saved in the extra work done, and freedom from injury by slipping.

Young Steers less than a year old, may be broken to the yoke by any patient boy. At first they should be yoked and tied up until they have become used to the yoke, when they may be led around and taught to drive. This is interesting play-work for a farmer's boy in winter.

Sheep.—A run on the stubbles is healthful exercise. A small plot of rape for green feed is always acceptable to the sheep, until the snow is too deep for them to reach it. See that they have plenty of pure fresh water, at least twice a day.

Cows will begin to fail in milk as the weather becomes cold, unless the food is of the best kind. Mangels or sugar beets, pulped and mixed with cut hay, corn stalks, or even straw, and left 24 hours to ferment, are productive of milk; and 2 quarts of corn meal, added to a bushel of this, will greatly help the yield of cream. Brewer's grains in small quantities, are a good food for milk production.

Fattening Animals should be pushed on as rapidly as possible. No fresh food should be given until

the refuse of the previous feeding is cleared from the troughs. When the appetite fails from any cause, a change of food will often restore it.

Plowing of heavy soils may be done to advantage until the ground freezes. It is well to plow under stable manure on such land. Light soils are quite as well if plowed in spring.

Wheat and Rye fields should be freed from surface water, and open drains cleared of leaves and rubbish. Top-dressing with fertilizers or manure, where necessary, should be done without delay.

Sundry matters.—The ice house should be cleaned out and prepared for ice, and a stock of sawdust be procured for packing. . . . The clearing of swamps may be done better a little later; tussocks cut easier when frozen. . . . Swamp muck for use as an absorbent may be dug now, and left to freeze dry ready for use in a few weeks. . . . Roots in cellars should be overhauled occasionally, and decayed ones removed. Cellar windows should be made secure against frost, either by a double sash, or outside protection of shutters. . . . Potatoes that are suspected of rot, may sometimes be saved by sprinkling dry slacked lime over them. Look for, and make all necessary repairs about the out-buildings. At the close of the year make an inventory, and if no accounts have been kept heretofore, it will pay to begin then.

Notes for the Orchard and Garden.

The careful cultivator will have so improved the past favorable autumn, that his work for this year is finished, and he is already looking beyond the slight barrier that separates him from the coming year, and his thoughts are mainly of the future. The Notes of the past few months include whatever of out-door work may be practicable the present month, and as much of what we might say has been anticipated, our Notes are of necessity brief.

Orchard and Nursery.

Not for many years have apples been so abundant as in the present, and as the crop has been short in most parts of Europe, immense quantities have been shipped. But few orchardists can benefit by this foreign demand, as the varieties suited for shipping are limited in number, and those tender fleshed varieties like the Northern Spy, King of Tompkins Co., Yellow Bell-flower, etc., that are so fine for home use, are not in favor with shippers.

Varieties for Europe.—Shippers place the Green Newtown Pippin at the very head of the list, and after that take such hard-fleshed long-keeping kinds as Spitzenberg, Baldwin, etc. It will be well for those who contemplate planting orchards with a view to shipping the fruit, to consider the merits of some of those southern varieties, which have in the Western States proved such great keepers, like the Nickajack, which, though not of high quality, has great beauty and will keep until March.

Fruit in the Cellar.—The great abundance of apples and consequent low prices at the time of harvest, is very likely to lead to neglect in caring for them, and it would not be surprising to find good fruit scarce next spring. There has been, in some localities, premature ripening, and this indicates that the fruit will keep badly. This calls for unusual care in selecting that which is to be stored, and in its management during the winter. The main point to be looked after, is the temperature, which should be kept as low as possible and not freeze the fruit. One great advantage in having a detached fruit cellar, or one not under the dwelling, is that ventilation is not necessary. In the home cellar the carbonic acid given off by the fruit must be carried off, or the family will suffer. In the special cellar this may accumulate, and by excluding the air, greatly promote the keeping of the fruit.

Cions, whether to be used during winter for root-grafting, or to be kept until spring for top-grafting, should be cut early. They are much more likely to succeed than those taken after exposure to severe winter weather. Saw-dust, damp as it comes from the mill, is the best packing material, as it leaves no grit to dull the knives.

Pruning of large branches may be left until the

severity of winter is over, but knife work may be done at any time; young trees may be cut back into shape, and large ones may be trimmed.

Manures.—The orchard is the only part of the farm that is expected to yield two crops, and so long as the practice prevails of taking off a crop of hay or grain in addition to one of fruit, so long shall we have complaints of bitter rot and other evils. Not only should the land be given up to the trees, when of bearing age, but these should be manured, if not every year, at least every third year, not by putting a small heap next to the trunk, but by spreading a good dressing over the whole surface. If the season allows, this may be spread now and turned under by shallow plowing. If the ground is frozen, draw out the manure and leave it until spring.

Various Matters.—Root grafting may be done on stormy days: work upon one variety at a time, to avoid errors; as soon as grafted, place the roots in boxes of earth, correctly label, and keep in a cool cellar until spring.... Destroy the eggs of the Tent Caterpillar if seen on the ends of the twigs.... See last month's Notes about rabbits and mice.

Fruit Garden.

But little is to be done, except to finish up fall work and get into winter quarters as soon as possible.... Unfinished pruning of grape-vines, currants, and gooseberries, may be done in mild days.... Strawberries should have their covering when cold weather fairly sets in. See article on "Winter Protection," p. 471.... The care for winter pears is the same as that for winter apples; when they begin to come into eating condition they are much improved by bringing them, a few at a time, into a warm room to finish off.... If tender raspberries are not yet covered with earth, do it before freezing prevents.... Apply coarse manure around currants, gooseberries, hardy raspberries, and blackberries; in the spring rake off the straw, and fork in the rest.

Kitchen and Market Garden.

The Notes of October and November suggest several things that may be done if the autumn is prolonged into the present month. In many localities the covering of spinach, the care of cabbages, etc., may be safely put off until now.

Cover gradually all crops that are stored out of doors. If celery in trenches is covered at once, there will be loss by decay, or it may be so warm that the plants will start into growth and the stalks become hollow. This, and roots in pits, etc., should have only a few inches of covering at first, to be thicker as the weather gets colder.

Cold Frames will need special attention. It must be remembered that the cabbages, cauliflowers and lettuce stored in these are not to grow, and that to allow them to start into growth will be very sure to ruin all. Only in very cold weather can the sashes be kept closed all day with safety. When the mercury is at 10° in still weather, the sashes must be lifted slightly, or pushed down an inch or two. If at 15° or 20°, more air must be given, and when it is at 30° or above, remove the glass altogether.

Cellars where roots are stored need to be kept cool, else the roots will shrivel or start into growth; in either case their quality will be injured. See what is said last month on covering with earth.

Seeds should be cleaned, properly labeled, and put away in a dry, cool place. Keep no stock concerning which there are doubts as to kind or quality. Some seeds, like the parsnip, are not good the second year, while others, like cucumber, etc., keep good a long time; hence a seed need not always be discarded because it is old. The works on gardening usually state the time that the seed of each vegetable retains its vitality.

Flower Garden and Lawn.

When we see, as we sometimes do, a lawn covered with coarse stable-manure, we are sure that there is trouble, in the way of weeds, in store for the owner. Only the most thoroughly composted manure should be used, and some contend that it is impossible to kill all the weed-seeds, no matter how thoroughly it is fermented. However this may be,

we know that there is no risk in the various artificial manures; if compost is used, apply it now.... Do not forget snow plows, as suggested last month.... Heavy falls of snow may do much damage to trees, especially evergreens; when this lodges in the trees, shake it out before it becomes icy and fixed; deep snow in settling will drag down the lower branches of evergreens, and may break them off; this should be prevented by shoveling it away and freeing the branches.

Greenhouse and Window Plants.

The general rules for the care of house-plants given last month will be timely all winter.

The Temperature is more easily regulated in the greenhouse than in the parlor or living-room. A temperature of 70° in the day-time is sufficient for ordinary greenhouse plants, and this may be 15° or 20° less during the night. With a proper heating arrangement, this is easily managed in the greenhouse, but in rooms it is often exceeded, and as the dryness is in proportion, the plants fare poorly. It would be better for the family if the temperature of the rooms was often governed by the needs of the plants, as they are generally overheated.

Hanging Plants, whether in baskets, or in suspended pots (see page 470), are more apt to become over-dry than others, and need special care. Baskets are best watered by plunging them in a bucket or tub of water, and allowing them to get thoroughly soaked through; of course dripping must cease before they are returned to place.

Chrysanthemums that have bloomed in the house should be cut down, when past their prime, and the pots be placed in the cellar or a pit; in either case they should not become dust-dry.

Plants in Cellars.—A good cellar is an excellent place for storing plants that are used for summer decoration, and as a reserve place for winter plants. Being dormant, they need but very little water, but they should not be allowed to dry out altogether.

Bulbs in Pots, when they have made roots, which may be known by turning out the ball, are to be brought into the greenhouse, or warm room, where they are to flower. It is better to bring forward but a few at a time—say at the interval of a week or so—in order to have a long succession of bloom.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, from our record kept daily during the year, show at a glance the transactions for the month ending Nov. 13th, 1878, and for the corresponding period last year:

TRANSACTIONS AT THE NEW YORK MARKETS.

Gold has fallen to 100½, as against 101½ on Oct. 12; 100½ on Sept. 12; 100½ on Aug. 12; 100½ on July 13; 100½ on June 13; 100½ on May 13; 100½ on April 17; 102½ on Jan. 12; 103 on Dec. 12; 102½ on Nov. 12.... Business in Breadstuffs has been on a restricted scale; values have fluctuated considerably, leaving off lower, and more or less irregular. The export inquiry has been fair, especially for Winter Wheat, and for suitable grades of Flour, the latter chiefly for the English, West India, and South American Markets, and the Wheat largely for the Continent; but this demand fell off toward the close, influenced in part by the unfavorable tenor of the later cable advices. Spring Wheat has not been in much request, and the bulk of the business in this class has been in the grade of No. 3. Speculation has been rather less animated in Wheat and Corn.... Cotton has been further depressed in price, on free offerings, and a moderate call for supplies, outside of the speculative interest, which has been fairly active.... Provisions have been quoted variable in price; on hog products again much lower, leaving off weak; on Beef, firmer; and Butter, of strictly prime to fancy quality, higher, with a moderate movement reported.... Seeds have been more sought after, but as reduced figures for most kinds.... Tobacco has been of readier sale; and Hops have attracted more attention, while Hay and Straw have been in request at former quotations.... Wool has been about steady, but not in urgent demand; and holders have quite promptly met all requirements of purchasers at the ruling figures.

New York Live-Stock Markets.

Beefes.—The market opened heavy and prices fell off until the arrivals became more nearly in a ratio with the demand. With lessened receipts, a gain of ½¢. per lb. on the average, and ½¢. per lb. on low grade stock, was made. This gain was soon turned to loss, the aver-

age of last week being the unexampled low figure of 7%. Trade closed very weak with sales of Texans and Colorados at 7@7½c. $\frac{1}{2}$ lb on estimate of dressed weight of 55 lbs. $\frac{1}{2}$ cwt. Natives of same quality sold heavily at same rates; mediums of 55 to 56 lbs. $\frac{1}{2}$ cwt. sold at 8@8½c., many of these being taken for export; extras 56@57 lbs., sold at 10@10½c. $\frac{1}{2}$ lb.

RECEIPTS.

WEEK ENDING	Bees.	Cows.	Calves.	Sheep.	Swine.
Oct. 21.....	12,350	105	3,325	31,792	45,073

	Bees.	Cows.	Calves.	Sheep.	Swine.
Average per Week.....	11,207	127	2,995	33,529	49,464
do. do. last Month.....	12,104	71	3,611	32,622	31,088
do. do. prev's Month.....	11,238	66	3,677	28,749	26,007

The prices for the past four weeks were as follows:

WEEK ENDING	Range.	Larger Sales.	Aver.
Oct. 21.....	6 @10½c.	7¼ @8½c.	8 c.
Oct. 28.....	6½ @10½c.	7 @8½c.	8 c.
Nov. 4.....	6½ @10½c.	7¼ @9 c.	8½c.
Nov. 11.....	6 @10½c.	7¼ @8½c.	7½c.

Cows.—There has been more demand for good cows, but poor ones are neglected and unsalable. A number of good N. Y. State cows went off readily at \$55 to \$60 per head, and these prices may be taken as an index of the market. Poor cows were refused at \$35.

Calves. Have been quiet during the past month with prices ranging lower gradually. The range has been from 2¼@7½c. $\frac{1}{2}$ lb live weight; closing prices were 2@2½c. $\frac{1}{2}$ lb live weight for grassers, 2@4½c. $\frac{1}{2}$ lb for fed calves, and 5@7c. for good to fancy veals.

Sheep.—A dull market has prevailed, with some irregularity in prices. At the close prices ranged from 3½ to 4½c. $\frac{1}{2}$ lb live weight; choice wethers brought 4½c. $\frac{1}{2}$ lb., and prime lambs 4¼@5c. $\frac{1}{2}$ lb.

Swine.—Live hogs have been at times unsalable, and prices have receded considerably. 3¼@3½c. $\frac{1}{2}$ lb has been quoted at times, but without business, and at the close, the heaviest receipts ever known in the city in one week, broke the market to 3¼@3½c. $\frac{1}{2}$ lb., with a stronger feeling at the lower prices. City dressed have sold for 4@4½c. $\frac{1}{2}$ lb., and some sales of heavy hogs have been made at a shade less than 4c. Closing quotations are a little in advance of poor business.

The Horse Market.—But little business has been done the past month. Prices are somewhat lower. Sales of small driving horses have been made at \$100 to \$150 per head. Western carriage horses have sold at \$600@850 each. A pair of fine 15½-hand bays brought the latter price. There was no inquiry for heavy draft or car horses. A shipment of half-bred Normans from the West was made to France, this being one of the rare curiosities of the horse trade and a reversal of the usual current. 30 head of fine coach horses were shipped during the last week to London.

Beef Cattle for Southern Pastures.—"H. Q. A." Beaufort Co., S. C. Shorthorns, Herefords, or Polled Aberdeens may be used to improve the native stock of the South; and the Bermuda and other grasses, with cow-peas, clover, roots, corn, and cotton-seed, can be made to fatten them. But it can hardly be expected that these cattle can be as heavy or as thrifty as those pastured in the cooler climates of Kentucky and Illinois. Nevertheless, by good management, feeding beef ought to be made profitable in many districts of several of the Southern States. In many cases the Devon will be found superior to the Shorthorn on light southern pastures.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of room elsewhere.

The Best Holiday Present.—Send to a relative notice that you have paid for him a year's subscription to this journal, and all through the year every time a number arrives that friend will have a new reminder of your kindness. The many thousand hints and suggestions its pages will afford will be turned to profitable account, and supply additional cause of gratitude.

Choosing Seed Corn.—"N. S." Tucker Co., Va. There have been numerous experiments as to the effect of choosing seed from the ends or the middle of the ears. The general results have been that there is no essential difference; so long as the ends are well-developed, the seed is as good from the tips and butts as from the middle. Corn will not deteriorate if the best ears are selected and kept for seed year by year. There are farms in many of the older States where good crops have been grown for half a century or more from one variety of seed.

Sending Subscriptions.—No Letter Needed.—At the bottom of page 488 will be found a convenient blank form for filling up with names of subscribers. This form can be cut off without materially injuring the paper for preservation, and it will save the necessity of writing a formal letter to accompany the remittance.

Chicken Yard Fence.—When it is desired to keep chickens from straying about the farm or gardens, or to confine breeding poultry, the fence represented in the engraving will be found to answer the purpose, and while it is neat and substantial, it may be constructed at a low cost. Three light rails are nailed to the posts, two near the top, as indicated. Slats are fastened from the lower to the second rail; and others from the second to the upper one, their lower ends being placed between the ends of the bottom tier. The slats are 2 inches wide, split from inch boards; the total height of the fence is about seven feet. It costs no more to make a neat fence of this description, than the unsightly things so common with unthrifty farmers.

Farming on Shares.—"Capt. C. F. K." Fort Stockton, Texas. A plot of ground being furnished by one party, the seed and labor by the other, one-half the products to each is considered in many sections as a fair division. Exact justice in such matters, however, can only be reached by a careful estimate of the value of what each one puts into the partnership: the interest on the value of the land on the one side, and the cost of seed and labor on the other; then the products may be fairly divided according to these figures. If it be argued that the land-owner has no guarantee for skill and care on the part of the tenant, so the latter has no surety for the condition of the land. The halving system is a poor one at best, for what would be fair when land is worth \$50 per acre, would be no guide on \$10 land. No one rule can be made for general application, except the business rule.

Practical Floriculture.—Mr. Peter Henderson's work with this title, while it has been of value to commercial florists generally, has been especially useful to beginners. We have known of a number of cases in which persons in small places, with a taste for cultivating plants or those who were already engaged in market gardening, have, by the aid of this work, put up small greenhouses, which enabled them to add essentially to their incomes. There is scarcely a village or town in the country of 500 or 1,000 inhabitants, where a small greenhouse, one of sufficient size to meet the wants of the community, might not, in addition to other occupation, pay the owner a fair profit. The Germans seem to understand this, and in the towns around New York, the German tailors, shoemakers, and other mechanics have their little greenhouses, in which they raise out flowers for sale to city florists. Other mechanics can in a similar manner raise plants for sale. One of the great merits of Mr. Henderson's book is, that it recognizes the wants of people of small means, and gives directions for

building small and cheap structures, as well as large and costly ones, while it is at the same time very full on the propagation and care of the plants. In the present edition several chapters have been added, giving information on such subjects, as letters of inquiry have shown to be needed. The chapter on uniting floriculture with market-gardening will no doubt meet the wants of many who are already engaged in vegetable-gardening, and would like to add flower-growing to it, or who, fearing that either alone might not pay, would unite the two. Though the work is essentially enlarged, the price remains as before, \$1.50, post-paid, by the Orange Judd Co.

Over 20,000 Men, Women, and Children have received valuable articles free from this Office, in return for their kind efforts in collecting and forwarding lists of subscribers—with profit to themselves, and to those they have invited to become readers. The reader of this might as well be one of the thousands who will receive these premium articles the present winter, or even the present month. It is worth trying. See page 481.

Ten Thousand Five Hundred Barrels are a good many apples—yet this quantity left New York City for Europe on a recent Saturday. There is always a demand for our apples abroad, even in years of plenty there, as our fruit is much fairer and finer than theirs, as well as higher flavored. While we are glad that the Europeans get our fruit, we regret that but little of the profit of the shipment reaches the hands of our farmers. In this case the shippers make the money.

"Horse Sorrel" once more. In an item in the October "Basket," it was stated that we knew of no plant generally called by this name. This has brought out several letters, which show the utter confusion that exists in the application of common names. There are two very different genera of plants known as Sorrel. There is the genus *Oxalis*, of which in the older States there are three species, all with three-parted, clover-like leaves, and showy flowers with five petals each; one has yellow, one violet, and the other white, red-veined flowers. The other genus is *Rumex*, the Sorrel of which has spear-shaped leaves, and small flowers without petals. The common names as fixed by long usage in England and in most of the older States here, are: for the species of *Oxalis*, "Wood-Sorrel," and for the species of *Rumex* in question, "Sheep-Sorrel." These common names have been adopted by the botanists of both countries, and it is very desirable that they should, for the sake of definiteness, be generally observed. But it seems that in some parts of this country the common name belonging to *Rumex* has been shifted to *Oxalis*, and that is wrongly called "Sheep-Sorrel," while *Rumex*, being thus deprived of its rightful name, is furnished with another—"Horse-Sorrel." We can see no reason for this change, as the names as mentioned above have been so applied for many years—we may say for centuries, as Parkinson in 1640 figures *Oxalis* as "Wood-Sorrel," and *Rumex Acetosella* as "Sheep-Sorrel." Let us try to preserve as far as possible uniformity in the use of common names of plants.

The Grape-Vine Raspberry.—An "Agent" is around among the Kansas farmers trying to get orders for a new variety of Raspberry called the "Grape-Vine." This is said "to look just like a grape-vine, and to grow from year to year the same."—We repeat, that new and valuable plants do not first make their appearance in the hands of peddlers. When these chaps offer anything new and wonderful—don't order it.

When You read this number through, please consider whether there are not hints and suggestions that you would not be without for the cost of the paper per year. Well, all through the year to come, many active, intelligent people will be all the while hunting up other new suggestions and information to fill up the pages. We feel sure that it will pay you and your neighbors to have the paper. Please bring them along to enjoy and get the benefit of our chatting circle for the new year, 1879.

Packing Eggs.—"E. A. D." Lamar, Mo. It is "milk of lime" that is used to preserve eggs, not milk and lime water. When eggs are preserved by packing them in milk of lime, or by oiling, it is not necessary to put them in salt; chaff, cut straw or any other light material may be used to pack the oiled eggs. Oiling will not answer when eggs are packed for sale, as it injures the appearance. There is nothing else better than the lime.

Quinsy in Hogs.—"P. M." Hemlock Hollow, Pa. Quinsy, common in hogs that are exposed to cold and damp, is an inflammation of the throat, with swelling of the glands, and if this is excessive, there is danger of suffocation. To prevent it, keep the pigs warm and dry. Treatment of the disease: rub mustard paste upon the throat, put the pigs in a warm place with plenty of dry bedding, and give warm linseed or oat-meal slops.

The Next Volume

Of this Journal, will far excel the present one, and all previous ones, in useful, practical, and varied information, which will be valuable to every reader.

Reading Pays, not merely in what tells one that he can at once do, but the thoughts he gets in reading what others do and say, incites thoughts and plans in his own mind that result in profit. The reading, thinking man makes his head help his hands. Brains tell everywhere, and in nothing more than in farming, gardening, and housekeeping. The fewer brains one has of his own, the more should he get all the facts and suggestions he can out of other people's thoughts and experience.

Bound Copies of this volume, and of every previous volume back to Vol. XVI. (1857), neatly bound, with gilt backs, Index, etc., are supplied at \$2 each (or \$2.30 if sent by mail). See Publishers' Notes, on first page.

The Kind of Farming that Usually Pays.

—In his "Talks," pages 462-3, our contributor returns to a subject that he has often talked about and brought forward in many ways, and with numerous illustrations. But the lesson is none the less important, and it should be carefully considered by every cultivator.—Timothy Bunker, Esq., over the signature of "Connecticut," gives a forcible example on page 463. Land so drained and worked as to be independent of rains and drouth, and so treated as to secure a large yield, as a general rule, is sure to be profitable, taking one year with another. Take this Connecticut instance: Which would have been the most profitable: to have continued trying to get something from the land worth \$5 an acre; or, if necessary, to have sold 9 acres of it, and expended the \$45 got for it, on the other two acres? In the latter case, he would get a good profit from the work on the two acres; but he would grow poorer while working the 11 acres. Brethren, think on these things. Thinking pays as well as working—and reading other men's thoughts helps one to think. "Brains" is a most excellent manure, as our good friend Timothy Bunker, Esquire, would say.

Borers.—"J. A. J.," N. Y. City, does not bore one by the length of his letters. "Please let me know how I can get rid of borers in an apple-tree?"—is plain and comprehensive. He allows us to infer that he knows they are in the tree. The Round-headed Borer, the one known in the Eastern States as the borer, lives for two years on the sap-wood of the tree, and may be cut out by the use of a strong knife; in the third year it enters the solid wood of the tree, when it must be followed by a wire and punched to death. When the borer is once in the trunk, no external application will avail; equally useless is plugging the holes, recommended in some papers.

New-Zealand Wagon.—"S. F. E.," Dunedin, Otago, New-Zealand, sends a sketch of a wagon with the following description: "I had a double-shafted wagon built to order, with hind-wheels 6 ft. high, fore-wheels 5 ft., tires 6 inches wide, and iron axles; body 3 ft. deep, and 12½ ft. long. This wagon was so easy-running, on

A NEW ZEALAND FARM WAGON.

account of the high wheels, that I drew it myself, a yard forward, and backed it, though it weighs 1 ton 8 cwt., and I weighed less than 11 stone at the time. It was used in carting some manure from 8 miles away, 4 horses being attached (2 and 2), and for the last load, to finish the job, we drew 5 tons 16 cwt., or 7 tons 4 cwt., including the wagon. The road was good, but hilly; the horses were of moderate size, but drew the load without difficulty." This experience is valuable, as showing the superiority of high wheels for ease of draft. High wheels compare with low wheels just as a long lever does with a short one. The broad tires and iron axles don't less added to the easy running. Such wagons are inconvenient for loading, and perhaps less economical than lower and smaller ones for ordinary farm-work; but for large loads and long distances, this style is worthy of consideration. Thanks to our far-away correspondent

for his interest in the *American Agriculturist*. We have a large constituency in that part of the world, and like to hear from them often. America can learn from, as well as give instruction to, other countries.

To Prevent Canvas from Shrinking.—"Enquirer," Marshall Co., Iowa. If the canvas on your harvester is coated with boiled linseed oil, it will not absorb water and will not shrink. Apply two coats on both sides of the canvas, and give it a coat every season afterwards. A large sheet, thus prepared, may be thrown over the machine when there is danger of rain.

The Japanese Persimmon or Kaki.—The Rev. Henry Loomis, San Francisco, who has been engaged in introducing the Japanese Persimmon into California and other parts of the country, sends us a neat album containing reproductions in colors from Japanese paintings of this fruit. There are nine varieties of different sizes and shapes; they are mostly scarlet in color, two of them being yellow. We have before mentioned the excellence of the fruit, and hope it may be found adapted to a wide extent of country. The limits of its hardiness have yet to be learned by experiment; our own experience, a short distance north of New York, has not been favorable. It is hardy at Washington, D. C., and is reported to be so at Flushing, Long Island.

Convenient Gate-Latch.—"A. V.," New York, hands us a sketch of a gate-latch, which is an improvement on the ordinary form. It is a long flat bar of iron, turned up at the outer end, and fastened by two bolts near the inner end, as indicated in the engraving. By this arrangement the latch becomes a spring, and forces itself into the catch when the gate is closed, with the surety of keeping it there, even when slammed to. The failure of a latch to stay in the catch, is a frequent cause of annoyance and inconvenience, and often results in the straying of animals from the pasture or yard.

SELF-FASTENING GATE-LATCH.

ment on the ordinary form. It is a long flat bar of iron, turned up at the outer end, and fastened by two bolts near the inner end, as indicated in the engraving. By this arrangement the latch becomes a spring, and forces itself into the catch when the gate is closed, with the surety of keeping it there, even when slammed to. The failure of a latch to stay in the catch, is a frequent cause of annoyance and inconvenience, and often results in the straying of animals from the pasture or yard.

Rape.—"S. C.," State Center, Iowa. Rape may be grown for feeding, but it will not pay to grow it for seed, because there is no demand for it as a source of oil. It is, however, an excellent crop for fall and early spring feeding. A peck of seed is sown per acre as for turnips, in July, to be eaten off in September and later. Or it may be sown in September, and eaten off in the spring.

A Good Dinner for Four Cents seems a very low price, yet it is possible in a family of six—two adults and four children, as stated last month in our notice of Miss Juliet Corson's little book entitled "Twenty-five Cent Dinners." It was there announced that the Orange Judd Company were to become the publishers of this work, which they have done at the suggestion of the editors, who were so well convinced of its usefulness, that they felt it should have the widest possible circulation among all classes of the community. The work was written to teach the wives of mechanics and others of moderate income, how to live both well and cheaply. Many cook-books in their recipes direct this and that, without regard to expense; in this little work the cost of everything is counted, and we regard this as a most useful feature of the book, as it is quite as important for the wives of farmers and villagers to count the cost, as for city house-keepers. But after all, we think that the chief utility of the work will be in showing how easy it is to have a variety of food, and whatever will do this must be useful. Fried meat, or the meat put into an oven, baked to a crisp, and called "a roast," are quite too frequent in this country, whether in city homes or farm houses, while soups and stews are correspondingly rare. The present edition has a chapter prepared especially for it on the preparation of fruits for the dessert. The "Twenty-five Cent Dinners" is sent for Twenty-five Cents from this office, by mail, post-paid.

Light in the Dairy—Animal Odor.—"J. A.," Wash. Territory. Light has the effect of deepening the color of both cream and butter. It is well to have abundant light in a dairy, but let it be protected from the direct rays of the sun, lest the temperature be raised excessively. The so-called "animal odor" is something of a hum-

bug. It is a new sensation in dairying. When cows are cleanly fed and kept, the animal odor is not disagreeable. The "sweet breath of the heifer" was noticed by Virgil, and by every dairyman since. But these sweet-breathed heifers do not cat horse-droppings in filthy yards, nor stand up to their knees in dung. That is where the animal odor usually comes from.

Quantity of Grain for a Colt.—"M. D.," Scotia, Neb. It is not well to give much grain to colts during their first winter. If fed too liberally, then, they are quite sure to do poorly on pasture-fed the next summer; enough should be given them, however, to keep them growing and healthy. A pint to begin on, and not over a quart a day later, is sufficient the first winter. Ground oats is an excellent grain-food for colts. An occasional small foddering of chopped roots is beneficial.

Excess of Salt.—"J. F. G.," Almont, Mich. Salt in excess is injurious to animals. It acts then as an irritant and produces inflammation of the throat and intestines, and sometimes it causes diarrhoea. A small handful is sufficient at one time, and it should be given with the food when not kept constantly before them.

The Shepherd's Manual, By Henry Stewart; a new edition. This work has had a remarkable success, and the reason is evident. It is the only work of late years, that gives all the breeds a fair showing. The American works that immediately preceded it, were devoted to a particular breed only. In a country so varied in its natural features as ours, it is folly to suppose that one breed of sheep is best suited to all sections. This work is not devoted to wool producing only, but recognizes the fact that there is an increasing demand for mutton, and that the raising of early lambs is a profitable branch of sheep raising. The work is not merely the reproduction of some English author, but its teachings are from American experience, and it covers the whole subject of the shepherd's management, in a very satisfactory manner. The work has been revised by the author, for a new edition, and he has added an important chapter upon the various localities suited to this important branch of agriculture, indicating the breeds and crosses most likely to succeed in each. Though thus enlarged, the price remains the same, and it is sent post-paid by the publishers, the Orange Judd Co., for \$1.50.

Guano on Grass Lands.—"J. T. N.," St. John's, Newfoundland. Guano, and other fine, concentrated fertilizers, should be applied when growth is beginning, which, for grass, is in early spring. It is not necessary to compost these fertilizers, unless to secure even distribution, as they are already in the condition to furnish plant-food. A fertilizer distributor is an economical machine when large quantities are used (say for ten acres or more). When chemicals or other fine fertilizers are mixed together, it should be done immediately before using them.

Subsoiling in Minnesota.—"K. O. S.," Lake Park, Minn. It will hardly pay to subsoil rich prairie land. If "it is too rich for wheat," sow the wheat very thinly, about half a bushel to the acre. There will then be less danger of the crop lodging from weakness of straw, which will be stronger, and the grain will be heavier, and more of it. It will pay to try thin seeding.

A Cheap Ventilator.—There is no necessity for an expensive ventilator for a stable or barn. The simplest method is to connect the stable floor with the outer air by means of a square wooden tube, the upper end of

CHEAP VENTILATOR.

which is carried through the roof about a foot. A cap, made as shown in the engraving, is fixed to the roof over the opening of the tube to keep out rain and snow. This answers all the purposes of ventilation, and can be constructed at small cost by any ordinary carpenter.

Guernsey Herd Book.—The prominence which the Guernsey cattle are assuming in this country, must be pleasing to those who know the value of the breed for its milk and butter qualities. We have at hand the first volume of "The Herd Register of the American Guernsey Cattle Club," recently published, and edited by Edw. Norton, Farmington, Conn., Secretary of the Club. Bulls to the number of 96, and 217 cows, are recorded, which indicates a larger number of pedigree animals than many had supposed were in the country, as these figures probably include but a portion of the entire number

Save the Index Sheet, which is put loosely in this number, so that it can be bound or stitched at the beginning of the volume. It enumerates about 2,000 valuable, paying facts and suggestions, and 600 illustrations.

\$100 for 13 Cents.—A Cow that Sucked Herself.—A Business Man furnishes us the following for publication, but "don't want the notoriety of having my name in print:" "....I have taken the *American Agriculturist* for many years, and always find in each number some hint or suggestion that I would not be without for its cost, of 13 cents. Here is an illustration of the value of one number. I had a fine blooded Jersey cow that cost me \$150, and was worth it to me, until she contracted a habit of sucking herself. I tried various remedies, including an unsightly head frame with projecting sharp points. I was so disgusted with the creature that I would have jumped at an offer of \$50 for her. Your paper told me to put a short piece of small gas-pipe across her mouth, leaving the ends open, and make two or three small holes in its middle, tying it in with a small cord extending to the horns. I had this done with a bit of iron pipe I chanced to have. The air admitted through the ends and little holes prevented suction; the pipe did not interfere with her eating, or make much show, while it entirely broke her of her bad habit, and after awhile it was left off. Now I would not take \$150 for her as a milker and breeder. That item was surely worth \$100 to me, and that number cost me only 13 cents. I say to every man: you can't fail to get some hints every year if not every month that you can not afford to be without for many times the cost of the paper."—[We have multitudes of testimonials of a similar character.—Eds.]

Jewel to Prevent a Cow from Sucking Herself.—A subscriber sends a model of a "jewel" which is used in the nose of a cow that sucks herself. It is made of some soft, tough wood, such as bass, poplar, or ash, and about twice as large as the engraving

A WOODEN JEWEL FOR A COW'S NOSE.

represents. The distance between the knobs of the two lobes is about $\frac{1}{4}$ inch, just enough to permit their being pressed over the thick edge of the cartilage of the nose, and close enough to keep the "jewel" in place. The instrument hangs down over the cow's nose, and prevents her getting the teat into her mouth, but does not hinder feeding. It is an easily made and practicable device.

Price of Milk at the Factories.—"T. B.," Saginaw, Mich. The factories are now paying less than one cent a pound for milk. When cheese is 10 cents, milk should be worth about one cent per pound; for it requires 10 pounds of milk to make a pound of cheese. The value of milk depends upon the prices of its products: cheese and butter. The better these are, the higher price they bring, and the more the milk is worth.

Good Service Complimented.—At the recent annual fair of the Farmer's Club, Dr. Cramer, President of Trinity College, North Carolina, addressing Capt. A. Parker, said: "By request of the Society, I present you, for your prompt attendance at every meeting since the Society was organized, a copy for the coming year of the *American Agriculturist*, the best Agricultural Journal in the United States...." (a double compliment!). So writes Chairman D. Reid Parker....**QUERY:** If each one of the 3,500 Agricultural Societies, more or less, in this country, should similarly compliment each officer having the same claim to recognition, as Capt. Parker, by how many copies would the circulation of this journal be increased? "We pause for reply."....P. S.—We cannot calculate upon a large increase from this source, first, because we fear there will be comparatively few who are able to show such a record; and, second, because, as a rule, the active, enterprising men who are foremost and most faithful in helping on agricultural improvement, are already regular readers of this journal.

The Nettle Story.—Certain newspaper statements, like comets, have their orbits, and come around again at intervals. At one time it is the man who produced seedless apples by putting in a bud upside down; at another it is the one who produced the sweet and sour apple by inserting the halves of two buds. Just now it is the Nettle, and we can hardly take up a paper without

seeing a statement of the great value of the Nettle as a fibre-producing plant, and that our Consul somewhere has communicated the important news to our Department of State. The last article upon this subject that we have met with, concludes thus: "The question occurs how a plant possessing such a variety of merits should have been for ages regarded as the most noxious of weeds?"—Having heard of Nettle linen as long as we have known about the uses of plants at all, we, as a matter of curiosity, traced back the uses of the Nettle fibre. Having reached the ancient Egyptians, we stopped in the search. There are now parts of Ireland, Scotland, and of Germany, where the country people have used for ages and still use the Nettle fibre to make their household linen. The reasons why it is not more cultivated are: the small quantity of fibre and the difficulty of separating it, and the fact that to produce a really fine fibre, the richest possible soil is required.

Other Journals and Magazines in Club with the American Agriculturist at materially reduced rates. See page 183.

Mocking-Bird Food.—"A. W. C.," Fall River, Mass. Mocking-birds are difficult to keep, but, with care in feeding, the obstacles may be overcome. For a steady diet, use corn-meal and milk (made up twice a day to insure its sweetness), with a little chopped, hard-boiled egg mixed with it, and some mashed potato occasionally. Chopped beef, flies, and spiders, should also be fed them, or if turned loose in the room, they will catch insects for themselves. Cherries and berries, especially Pokeberries, in their season, are much relished by the birds, and are a necessity to insure health. Regularity in feeding, and care, and cleanliness, are essential to success.

Mixed Corn.—"S.," Genyo, West Va., having corn with both white and yellow kernels on the same ears, inquires about planting this mixed seed, as these ears seem more solid than those bearing kernels of only one color. We do not believe in "mongrels" of any kind, and doubt if the mixed ears have any advantage in the way of solidity that may not be found in some established variety. Evenness in ripening is often important in the corn crop, and the two sorts in these ears may mature together or not. A field planted with this seed would have some stalks bearing all yellow and others all white ears, while many would be more or less half and half. If there was a week's difference in ripening, a part of the crop would be cut up too soon or too late. Besides, there is a chance of loss from imperfect fertilization—a matter we have not space to discuss here. We favor attempts to improve Indian corn, but planting mixed seed is not likely to lead to any good result.

The Illinois Horticultural Society.—The 23d annual meeting will be held at Springfield, Ill., on Tuesday, the 10th inst., and continue for four days. The programme is full and attractive, and rail-roads and hotels reduce their fares. Mr. O. B. Galusha is Secretary, and we would give him due prominence and thanks as just one Secretary who sends us the notice of a meeting in time for us to publish it. Re-elect Mr. Galusha.

Covered Milk-Pail.—The Dairy Supply Co., of New York, exhibit a milk-pail which excludes all dust and dirt from the milk. As shown in the engraving, its cover is somewhat hollowed, to make it strong, and is used as a seat for the milker. The funnel projects under the cow, and occupies a convenient position for receiving the milk; it is connected with the pail by a heavy rubber tube, so that if kicked by the cow, no damage is done; in the lower part of the funnel is a wire-gauze strainer which prevents any impurities getting into the pail. The result, with proper care otherwise, is clean milk; no danger of loss by the cow's putting her foot into the pail or kicking it over, and greater convenience

to the milker than the ordinary pail affords. This pail makes some amends for even a careless milker; but a lazy or slovenly man need not think that it will remedy the result of his sloth or carelessness, or give better milk.

Concrete Floors for Cow Stables.—"A. G. W.," Navarino, N. Y. Concrete floors are "a good thing for cow stables, where part of them are to be stanchioned, and part kept in box-stalls," or otherwise; but such

floors especially require the use of absorbents, as fine earth, muck, or plaster, etc. The stanchions and partitions are fastened down by bedding them in the fresh concrete, or by drilling holes in it when dry. Gutters are easily made in the concrete, by laying down a "form" of the desired width and depth, and "puddling" about it. A good concrete may be made of 1 part cement, 1 part lime, 6 parts sand, and 4 to 6 parts of small pebbles. "An inexperienced man," who is handy with tools, knows how to make mortar, and has sufficient judgment, can lay such a floor. The surface is made smooth by levelling, pounding with a maul, and finishing off with a mason's trowel or other smoothing instrument.

Ratio of Corn-Stalks to Grain.—"B. S. N.," Washington, D. C. The relative proportions of corn-stalks to the grain depends on the soil, manure, variety, cultivation, and season, either one of which may modify the ratio—a tall, rank-growing variety has a much larger proportion of stalks than a small-stalked, many-eared sort. Rich, nitrogenous manure develops more stalks than grain; a wet season more; good cultivation reduces it, and poor soil and poor manuring give an undue proportion of stalk. We quote from several experiments, which show the range of the proportions:

Acres.	Grain per Acre.	Stalks per Acre.	Lbs. Stalks to 1 Bush. Grain.
16	75 bush.	6,000 lbs.	80
8	120 "	9,640 "	80½
—	82 "	8,240 "	100½
—	318-10 "	5,122 "	149

* The average yield in Massachusetts, taken several years ago; the yield is larger now.

The above figures are all of northern corn; probably the western and southern varieties would show different proportions, though no more regular. Other estimates allow $1\frac{1}{2}$ to $2\frac{1}{2}$ tons for a 50 bushel per acre crop. The variety of seed and the treatment, which produce the smallest amount of straw for a given amount of grain, is the most desirable. Thoroughly dry corn-stalks can be baled the same as hay and straw, and not heat.

Bronze Turkeys.—"J. H. S.," Logan, Ind. Bronze turkeys are the result of a cross of the wild turkey upon the black; or it may be that they are only the wild race domesticated. They are much larger than the common black variety, the male birds often weighing 30 or 40 pounds, sometimes more, when fully grown.

Pearl Millet in Canada.—A. Coindet writes that he procured of Wm. H. Carson (125 Chambers St., N. Y.) the seed of Pearl Millet, and sowed it in a yard in Montreal. The soil was not manured, and the yard had the sun for only about two hours in the day. He sowed May 20th, and on July 15th, it being five feet high, he cut it; he cut again on Sept. 15th, the height being six feet, and again on Oct. 1st, when the stalks were nine feet in height. Mr. Coindet states that both his horses and cows were very fond of the millet, green or dry.

"Stock Breeding," by Manly Miles, M. D., late Professor of Agriculture in the Michigan State Agricultural College. New York: D. Appleton & Co. This work comes to hand just as our last pages are closing, and we can barely announce it, much less review it. A long acquaintance with the author and his enthusiasm in this specialty, his scientific thoroughness and conscientious accuracy, allow us to say that, whatever is stated in the work as fact, may be relied upon; and whatever is given as opinion, is sure to be honestly entertained. Sent from this office at the Publishers' price, \$1.50.

Letter From South Australia.

The editor of the "Australian Star," Adelaide, South Australia, in an interesting letter to the editor of the *American Agriculturist*, writes: "In your July issue, you remark, 'The Australian farmer can by no means rejoice over his American brother; on the contrary, the latter may congratulate himself, that he is not the only, nor the worst sufferer, from small wheat crops.'—It is true that our average yield is small, for in 1875-6 it was $11\frac{1}{2}$ bushels, in 1876-7, $5\frac{1}{2}$, and only about $7\frac{1}{2}$ bushels last season, but our farmers are far from poor. A man can purchase 1000 acres in South Australia at \$5 per acre with nine (9) years credit. He has to deposit ten per cent of the purchase money, which sum is regarded as interest in advance for 3 years. With the aid of a South Australian invention called a Ridley reaper, which takes off the ears and leaves the straw standing, his wheat will not cost him \$6 per acre. The farmer can, therefore, count on clear profit the value of every bushel in excess of 5 bushels to the acre. Late frosts and red rust spoil the last harvest, and many farmers were obliged to cut their wheat for hay, while others, hoping to reap ten bushels to the acre, found the ears only half filled. The highest yield was 35

bushels per acre, the lowest was not worth securing. South Australia has secured the Grand Prize at Paris, for wheat, and is destined to be one of the greatest wheat-producing countries on the globe; we never had such good prospects of a large yield as we have now. Unfortunately, late frosts or red rust may again blight our hopes. Should your readers require any further information on wheat-growing in South Australia, you have only to ask for it and it shall be furnished."

Sundry Humbugs.

Here, at the close of the year, we find our humbug budget quite as large as, if not larger than, it was at the beginning, and we naturally ask ourselves if our work in this department has been productive of any good. We do not regard the enlarged correspondence in this line as indicating that fraud is on the increase, or more successful than heretofore. It only shows that our influence is extending, and as our exposures become more widely known, we are more frequently applied to by those who have received the proposals of swindlers, and those who, having been

duped, wish to warn others. Had we not the satisfaction of knowing that our labors have been productive of good, we should not, as a matter of choice, continue these exposures. We do not find room to publish the many letters of thanks and appreciation of our labors that constantly come to us; indeed, we seldom make a journey of any considerable length without being personally thanked by persons for our efforts in this direction. Some swindles appear to have a short run, and are heard of no more; others are persistent and perennial, and continue, if not the same in form, the same in nature, year after year. We write no valedictories to our readers, as we assume that our present friends will continue, and bring some others with them; but the end of the year is a fitting time for calling attention to those leading forms of fraud that now prevail. Firstly,

THE FRAUDS UPON FARMERS.

which are much more frequent than is generally supposed, as the majority of the victims, ashamed of having been duped, "grin and bear" the loss in silence. Those who operate among farmers have a shrewd knowledge of human—we may say, farmer—nature. They know that farmers, who generally work so hard for what they earn, will look with favor upon a scheme which will allow them to make money both honorably and easily. Besides this they know that farmers, being generally honest themselves, are unsuspicious of others, and may be caught by methods that would not succeed with shopkeepers and others who are always on the look-out for some crookedness. We have often printed the injunction,

FARMERS, BE CAREFUL WHAT YOU SIGN,

and have wondered if there were no easy method of keeping it always before them. If our humbug column could so impress its importance, that every farmer, or other reader, would always, and habitually and carefully, read and understand whatever they put their names to, we should feel that our year's work had been attended with most useful results. Here is one of the simplest—and we regret to say, commonest—instances. Scene—a farm-house in Queens Co., N. Y. A glib-tongued chap comes in with a Patent Rest for a wagon pole or tongue—no rest, patent or other, for the *waggin' tongues* of these chaps—he convinces farmer that this is something every other farmer must have—in fact, can't live without; they have only to be known, to "sell like hot cakes," at \$5 each; and as he, with the glib-tongue, must leave by next train, he will appoint farmer agent for the sale. Farmer does not know that he has made the same offer at the last house, and will do the same at the next. He thinks that the offer, half the amount, \$2.50, on each one sold, is liberal for his share, and consents to become the agent. That there may be no mistake about the matter, farmer will please *write down his address*, in his book, so that the goods may come all right. A proper enough request, and the farmer writes his name very plainly. Days, a week, two weeks passed, but no wagon-pole things came. But something else came. Neighbor Blank, who lives up the road, called to see if it was convenient for the farmer to pay that little note. "Note!" He owed no note to any man living. Neighbor B. showed a note for \$15, on demand, which, having the money doing nothing, he had bought at a slight shave of

the wagon-pole man. Queen's Co. farmer could not deny the signature. In merely giving his *address*, he had signed a note which was all in legal form. When we hear of such cases every month, is not our warning needed? A similar case occurred in Calhoun Co., Mich., but here

THE FARMER OUTWITTED THE ROGUE.

We wish we had space for the wife's letter just as written, but it is too long. Wife is a careful reader of the *Am. Agriculturist*, especially the Humbug columns. Husband was disposed to make light of this, and boasted that he couldn't be caught signing a paper that he didn't know all about. Stump-puller man came along, induced farmer to become agent, offering large profits. Farmer told his wife that he had signed an agreement to become agent. Wife asked if he had read the paper. "No, he had not his glasses with him."—Wife told him that he had probably committed himself, and so alarmed him that he went off to the neighboring town, found stump-puller chap, declined being an agent, and stump-puller man pretended to cross off his name with much flourish. In a week two chaps drive up to the farmer's house, inform him that there are 25 stump-pullers at the depot to take away and pay freight on, and that they would collect pay for one ordered for his own use. Farmer denied sending for them—chap, to prove that he did, takes out a paper with a triumphant—"you won't deny your own signature, will you?" Farmer would examine his signature more closely, gets hold of the paper, crushes it in his hand, and tells them he would keep it. Chaps threaten penitentiaries, state prison and search warrants, but farmer holds on to the paper. Chaps call in the wife, asking her to reason with the husband—wife tells him if he has the paper to keep it. She told the chaps that she reads the *American Agriculturist*, which they didn't seem to like, and gave them a piece of her mind on swindling in general. They propose various compromises, but all are refused, and they at last depart with many threats. The wife writes that she thinks that a man who will sign a paper without reading it should be punished a *little*, for she found that he had signed an agreement that would have ruined them to comply with.... Inquiries about

THE SEMINOLE GOLD MINING CO.

continue to come. A sufficient answer to all these is found in our "Editorial Correspondence" on page 458. Certainly that should satisfy the most credulous. We learn that this swindle is taking considerable money from some of the Western towns in one dollar shares. In one flourishing town in Illinois a lady acted as agent for their sale. One correspondent sends a copy of a letter from an officer of this "hole in the ground company," in which he speaks of our remarks as "idle and malicious." We wonder how he likes those of the "Laramie Sentinel," quoted on the page referred to—that "does the thing up brown." One correspondent in Lynn, Mass., writes that he owns thirty-one shares, but does "not know for certain if they are honest or not." Why should there be such a fascination about a gold mine as to induce persons to invest in it blindly? ...The

"IS THIS YOUR SIGNATURE?"

letters of Clark & Co., who "adjust claims," continue to come. It is funny that the amount of "Mining Stock" is always an even \$500. Of course these remarkable adjusters that adjust things, have a way of getting hold of genuine signatures, and this puzzles the writers thereof. We suggest that those who are at a loss to guess how Clark & Co. got possession of their signature, consider whether they have had, in the past, any correspondence with any "patent agency" in this city.... It fits with regret that we announce that

THAT COUSIN IS NOT YET FOUND.

This time it is H. P. Jones & Co. who are in the lost cousin business—though how a Co. can have a cousin, we can't understand. It is an old dodge, but may be new to some. "Jones & Co." use the singular pronoun; his letters inform people that, "In looking over your State Directory, your name attracted my attention"—"Jones & Co." reads directories—and very interesting they are; though the story is not altogether continuous. "A cousin of mine (*me* being J. & Co.), bearing the same name as yours, after the war, left his regiment, and we have not heard from him since."—Poor Jonesey & Co. I * * * "If you are my cousin" ("you will *not* have a strawberry mark on your left arm"—does he say?—not a hit, no sentiment about J. & Co., he means his; he continues:) "I can do you a favor and you can help me"—"Jones & Co." is the agent of a lottery—circular enclosed—J. & Co. will enclose coz. a ticket good for any one of the drawings—we haven't the least doubt it is just as "good" for one as for another—"with this understanding, that I will arrange it so that you will draw a large prize, (who says that lotteries are not honorably conducted games of chance!) if you will act as agent for the sale of tickets. * * If you accept * * I will arrange it so that you will draw the prize in next week's drawing." Then our long lost "cousin" gets, in a few days, a circular from W. P. McCall, notifying him that his ticket "has drawn an assorted lot of gold jewelry (45 pieces), valued at \$160"—

of course coz. has only to send and get his 45 pieces—not quite. "The percentage due for packing, shipping, etc. (especially 'etc.'), is \$13.50." Who would be cousin to "H. P. Jones & Co.!" He is a very numerous cousin, he lives in ever so many States; Jones & Co. can arrange his ticket, but he can't get his stuff clear of that percentage. H. P., don't you think that there is a gossamer thinness about this "cousin" business?

"THE QUEER" OR COUNTERFEIT MONEY

humbug, is, with the exception of lotteries and quack medicines, the most venerable of all the swindles. It was sufficiently noticed last month. A recent feature is the circular of A. C. Chapman—and a very pretty signature you make, A. C.—who don't have any of "a certain queer class of money" himself, but he knows a chap—man who has some prime, "on the most liberal terms."

LOTTERIES OF ALL SORTS

are among the perennial nuisances, and come in so many forms that we have no space to specify them—those only who let them entirely alone are safe from the more fraudulent forms. These lottery chaps show skill in advertising. The "Commercial Gazette" is an innocent-looking paper. Its outside pages have some talk about angels, and a quotation from the "Christian Union," all as "sugar-coating," for the two inside pages are broad-side lottery advertisements. Yet these things, in spite of law, and the vigilance of post-office officials, go wherever the mail reaches, especially the Far West.

THE SECRET SERVICE NONSENSE

and other Cincinnati schemes seem to be very quiet. Whether that wonderful corps of detectives is full, or these don't subscribe to the "Gazette," or whatever the cause, it seems to have subsided. What, too, have become of those distinguished lamp people, and that remarkable "Art" distribution. It must be very dull in Cincinnati. Of course reference to some of the leading forms of humbuggery, must include

QUACK DOCTORS AND THEIR MEDICINES,

which are more numerous than any other. We have not space to enumerate or specify. Our advice to every one and all the time is, take no *secret* remedy whatever; do not give it to the members of your family; do not treat your domestic animals with any secret compound, and finally, have sufficient respect for our good Mother Earth, and do not desecrate her, by dosing her with secret fertilizers... We would say to those who have been inveigled by promises of profit, to undertake the sale of quack medicines—no matter whether several "Barks," Bitters, Pills or Plasters; whatever contract you have made, the law will no doubt hold you to no matter how worthless the stuff may be. Get out of the scrape as you can, for you may be sure that one who will work upon the fears of the sick, and hold out false hopes to those already beyond hope, in their lying circulars, will have no mercy on a well man. Do not write to us, for we cannot help you. A bargain is a bargain. At the same time don't mind threats. Isn't one of these quacks who assumes the Friends' language, and thee's and thou's, sweetly in his quack pamphlets, just threatening a little more than he can hack up. The harks of some dogs are worse than their bites. We did not intend to specify any quack, but here is one too good to pass unnoticed. So

MAKE ROOM FOR SAGENDORPH

and his battery! S. is "offering to the public Batteries which are made of *newly discovered metals*." He need not add that they produce "results not less *startling* than *salutary*"—for his mere announcement is "startling" "newly discovered metals!" there must be at least *two* of them—and don't you know, Sagendorph, that one "newly discovered metal" is all that the greatest chemist in the world would ask as his passport to undying fame! But here are *metals*: Sag, we congratulate you. Your battery which is "constantly though imperceptibly impregnating the *Nerves and Blood* with new *Electric Life*" is a battery that heats the telephone, microphone, phonograph or any other phone or graph ever invented.

Farming East—Farming West— Farming South.

A capital joke, upon himself, is doubtless remembered by many readers, of an editor starting an agricultural paper in a Western Capital town. In his first number, with 21 octavo pages of reading matter, he used two of them in urging people not to go East, but to take a home paper, "adapted to their own wants." The joke was, that of the other 19 pages, 16 of them were filled with matter prepared for and first published in the *American Agriculturist*, though less than half of the articles were credited. They were scissored from places where their paternity was omitted. This is an illustration of a good deal of nonsense uttered to help out somebody's

personal ends. There are a few special points of difference in the modes of tillage and harvesting, and in the crops grown in different sections of the country; but the *foundation principles of successful crop-growing, feeding, and marketing, are the same everywhere.* So are those of the mechanical appliances that now enter so much into the operations of profitable soil culture. We will not stop to illustrate here. This Journal has for twenty years circulated very largely all over the Western States, and largely at the South, and the testimony to its utility has been constant and great, though we have always ignored special attention to locality. (The largest circulation in proportion to population has usually been between Ohio and the Pacific Ocean.) But there are some reasons, just now, for our giving increased attention to the peculiar features of Western and Southern agriculture. *First*, the depressed condition of trade and manufactures in the older States is leading hundreds of thousands, or millions indeed, to look to the broad, unoccupied lands in the Western and Southern States, as inviting fields of labor, and future homes. We will try to aid them in their desire for more specific information.—*Second*, the demand, greatly on the increase, for meats, to be taken, alive or dressed, to Europe, makes the grazing and fattening of good stock at the West, as well as the East, especially at the West, and probably at the South, a subject of much importance now. *Thirdly*, it is our province to meet the wants of those who are at the West, and who think they need special and peculiar information particularly adapted to their work. This we shall look to. The truth is, our great American field is one in interest, and it will be our greatest pleasure to aid in developing every part of every section to the highest point possible.

We invite suggestions, queries, and information from all points, West and South, as well as East. Special editors or contributors residing in different localities will look after the special needs and information required in each section.

"To Do Good and Make Money."

Eight and twenty years ago the writer was in the Yale Laboratory, with Silliman, Norton, S. W. Johnson, Brewer, Weld, Willet, Safford, Shepherd, and other now distinguished men—all wrestling with practical chemistry, trying to find out what it could do, and what it could not do, for the improvement of soil culture. What it could not do, for there were wonderful hopes indulged then, by true, earnest, scientific men like Liebig, and more wonderful claims put forth by those who had a mere smattering of chemistry, especially those who had an ax to grind in the making and selling of fertilizers.... One morning, a man came in to sell an Almanac, a good one, the title-page of which read: "Beckwith's Almanac," "Published To Do Good and Make Money." That motto left upon the writer a strong impression. What higher motive for business enterprise and activity? He is a public benefactor, who makes two blades of grass grow where only one grew before, is a trite old adage, but it is a true one. All those who are laboring to this end, are doing a good work. Every man who helps get up and carry on agricultural societies, clubs and fairs, for disseminating information, is helping increase the blades of grass and the ears of corn. Every item of knowledge gleaned from meeting with others, from conversation, or from reading, gives a man new thoughts, and helps make his work more productive. Every man will be doing a good work who, this winter, helps diffuse information among his neighbors, by aiding in organizing farmers' conversational clubs, in circulating useful books and papers, etc. A few good books on farming, and Journals coming fresh from month to month, if circulated in any neighborhood, will have a grand influence, silent though it may seem and be, in developing thought, dignifying agriculture, improving practice, increasing products, and there will be a reflex benefit to him who helps in extending such influences. He will thus be "*doing good, and making money.*"—Our Publishers offer premiums, equivalent to money, to those who help increase the num-

ber of reading, thinking, cultivators. Those who work for these, will have a three-fold reward.

International Dairy Fair.

The importance of the International Dairy Fair, to be opened in New York at the American Institute building, 3rd Ave. and 63rd St., beginning Dec. 2, should attract the attention of all interested in dairy matters. If the exhibition equals the promise of the preparations, it will be worthy of the name it has taken, be a credit to the country, and result in substantial benefit to the industry. Several similar fairs have been held in Europe, with marked success. As competitors for European trade, American dairymen can not afford to neglect attending this exhibition, and learning what they can of improved methods and apparatus. The committees in charge comprise many of the leading dairymen, and the prizes offered are liberal enough to call out many exhibitors. The entries are numerous and important, many being from foreign countries. The classes include 8 of butter, 4 of cheese, and one of implements. The sum of \$500 is also offered in premiums for dairy cows, including all the prominent breeds in use in this country. Altogether it is an occasion that should call out the milk, butter and cheese producers in full force; and even if the fair should be a failure, a result we do not anticipate, it will teach us how to organize one on a better, more successful basis.

Editorial Correspondence From the Far West.

The Seminole Gold and Silver Mining Co.

The comments of the September *American Agriculturist*, upon "The Seminole Gold and Silver Mining Co.," are greatly relished in Rawlins, Wyoming Ter., where the so-called "mines" are located. The talk on the cars and elsewhere, is to the effect that certain parties dug a hole in the ground, some forty miles from here, sufficiently deep to conform to the territorial mining law; they then organized a stock company, and have since been selling the stock in the Eastern and Middle States, in large and small lots; furthermore, that the whole head and front of the Company is one J. M. Pattee, who formerly ran a lottery at Omaha, Neb., and afterwards at Laramie, Wyoming, at which latter place his circulars were excluded from the mails, thus causing a cessation of his business. Whatever may be the truth of these statements, there can be no mistaking the meaning and intent of the following language which we find in the "Laramie Sentinel" of late date, an influential journal, originally induced to speak favorably of the enterprise: "A SWINDLE.—We are frequently receiving letters asking for information about the SEMINOLE GOLD AND SILVER MINING COMPANY. We can't answer these letters—there are too many of them. But we will state in the most public manner possible, that the Seminole Gold and Silver Mining Company, J. R. Brown, President, with headquarters at Rawlins, W. T., IS A PURE FRAUD, SWINDLE AND STEAL. J. M. Pattee, of lottery fame, is at the bottom of it. THERE IS NO MINE, NO MILL, NO MACHINERY THERE, and never will be, and every man who purchases stock in it, is merely contributing to a lot of dishonest Dead Beats, who are making their living by gulling the public. If any one has any doubts on this score, we refer them to the Governor, the Judges of the Supreme Court of Wyoming, or any other responsible party."

Big Mormon Crops.

Wheat fields were frequently pointed out to us in Northern Utah, which had yielded, this season, from 50 to 55 bushels per acre, and we were shown potatoes of the "Peerless variety," raised by John Bowman of Uintah Station, Utah, which weighed from two pounds to two and one-half pounds each. The crops all through Utah, particularly in the Cache Valley, have been large this year.

Plenty of Game.

During the past few years, the far Western States and Territories have taken measures to pre-

serve the game from the forays of unfeeling Nimrods who mercilessly slaughter wild animals either for the love of killing, or to be able to boast of the number of their victims. As the result of these protective measures, there is, this fall, a very perceptible increase in game, especially in Wyoming and Utah Territories. Employees of the Union Pacific Railroad tell us that they never before saw so many antelope on the plains, while back in the foot hills and mountain ranges, elk and deer are abundant. In riding, during the month of October, from Rock Creek to Laramie, antelope, wolves, mountain grouse, sage hens, wild geese, ducks, etc., were to be seen from the cars almost constantly. The favorite point for English hunters in this country is about seven hundred miles west of Omaha. Here they leave the railroad track, and strike back forty miles to the Sweet Water regions. Having procured a guide and spent a few days at the hospitable ranch of Mr. Tim Foley, who is one of the largest and most successful cattle growers in the world, they push on to the Wind River country northward, in quest of the larger game there is to be found in that region. A small party of these English gentlemen returned from the Wind River country, a few days ago, with twenty-one bear skins and the heads of numerous elk, mountain sheep, etc., which they were conveying to England as trophies of their American hunting excursion.

Irrigation in Wyoming Territory.

Of the one hundred thousand square miles of area in Wyoming Territory, it has been computed that over seventy thousand square miles are adapted for grazing purposes only. It is not improbable, however, that much more land may be brought under cultivation, so that Wyoming may be classed in the future as an agricultural, as well as a grazing country. The famous plains of Laramie contain nearly three million acres of grazing lands, over which are now scattered fully fifty thousand head

of stock. Some of the leading citizens of Laramie have organized themselves into an association for the purpose of irrigating and raising crops on that portion of the plains lying north-west of the city. The name of the association is the "Pioneer Irrigating Canal Co.," and the leading spirits in the work are Judge J. W. Donnellan, Rev. D. J. Pearce, Baptist Minister, Rev. H. L. Myrick, the Episcopal Minister, and E. Iverson, Pres. Wyoming National Bank. The enterprise is not undertaken for money-making purposes, but has its origin in a desire to supply the city with farm and garden products, which are now brought a long distance by rail from the States at considerable expense and trouble. As will be seen from the accompanying illustra-

tion, a ditch is to be dug, fifteen feet wide, three feet deep, and thirty miles long, beginning at a point on the Big Laramie River, thirty miles southwest of the city, near Sheep Mountain, and extending to the same river at a point a short distance north of Laramie.

From the main ditch, secondary ditches are to be dug, by means of which fully fifty thousand acres of land west of the city, lying between the river and the main ditch, will be irrigated and brought under cultivation. At present, this tract is an open plain, dotted here and there with ranches and droves of cattle and sheep. The cost of this system of ditches is computed at from ten to fifteen thousand dollars. The engineer, Mr. F. C. Avery, who has superintended similar irrigation enterprises in Colorado, is sanguine that it will be attended with fully as successful results, notwithstanding the plains here are considerably higher than in Colorado. The citizens who are to bear the expense of this ditching system, are now locating whole sections of land within the proposed area, under what is known as the "Desert Act or Law." Any one has a right, under this Desert law, to appropriate six hundred and forty acres of desert land at \$1.25 an acre, by paying 25 cents per acre cash, and an additional \$1.00 per acre within three years' time, upon furnishing proof of his having reclaimed the land by irrigation. Furthermore, a revenue will accrue to those who supply the funds, from the sale of the water rights. The right to draw water enough to irrigate one hundred and sixty acres, is worth considerably more than the original cost of the land. At Fort Collins, in Colorado, this right is valued at from \$800 to \$1,000.

This particular valley, extending from the Medicine Bow River to the head of the Laramie Plains, and being about one hundred miles in length and fifty miles in width, is specially adapted for irrigation on account of the numerous water courses. The Big Laramie winds about through the valley for over one hundred miles, and the North Platte River, the Medicine Bow, Rock Creek, Dutton Creek, Little Laramie and other streams, flow through it. Should this first attempt at irrigation by the citizens of Laramie, meet with the predicted and anticipated success, it will undoubtedly be repeated on a large scale all over the plains.

During the past summer, potatoes, peas, and other vegetables have been successfully raised here, in the gardens of Laramie by means of the irrigation afforded through a copious spring just east of, and 200 feet higher than, the city.

Fish Culture in the Far West.

There is no industry which promises more liberal returns upon the investment than the propagation of fish in the far Western States and Territories, where there is a great scarcity of this kind of food. An enterprising fish breeder, who would construct ponds and raise superior kinds of fish for the market in either Colorado, Nebraska, or Wyoming, would be certain to realize very handsomely on his outlay. The prairie regions being subject to surface flowage every year, ponds should be constructed as remote as possible from points liable to overflow. In building them, care should be exercised to secure the cool healthful waters from the mountain streams. The nearer such ponds are to the foothills or mountain slopes, the better.

With the exception of mountain trout and some other fish, the supply in the far West is brought from the lakes and other remote points. Such fish are naturally expensive and not always so fresh and wholesome as might be desired. From inquiries made on the ground, we are satisfied that there is a demand here for fresh fish, in the supplying of which lies a fortune for enterprising fish culturists. Owing to the abundance of beef, the demand for fish as a change of diet is very general.

Kansas—Recent Immigration.

Kansas is smiling with prosperity, and her people are cheerful and happy over the improved condition of affairs. In travelling through the entire State, visiting the agricultural centres, the cities, villages, and other points of interest, I have heard but one expression of opinion, viz.: that hard times are over and prosperous times have come again.

The immigration into the State for the year I compute at one hundred and five thousand, basing my figures upon conversations I have held with the leading authorities, including the Governor, the State Board of Agriculture, and the various Railway Land Commissioners. While portions have been distributed through the eastern counties, the great bulk of this immigration has pushed on to the central and western counties, following the railway routes across the State. The sales of the Atchison, Topeka, and Santa Fe Railroad for the ten months ending with October, were 208,626 acres, as compared with 57,439 acres for the corresponding period last year. The sales of the Kansas and Pacific for the ten months were 182,000 acres, and the estimated sales for November were 20,000. In addition, there are the very large amounts of Government lands sold, preëempted, etc., of which no official aggregate data have yet been made up.

Prior to 1871 there were no settlements one hundred miles west of Topeka. During the years that have intervened since then, one hundred thousand people have moved into the region beyond upon the lands tributary to the Kansas Valley, as far as Fort Dodge. This population is scattered over an area of two hundred miles in length, and an average width of seventy-five miles. It lies about 37 miles each side of the Atchison, Topeka, and Santa Fe Road. The immigration is likewise following westward with similar rapidity on the line of the Kansas and Pacific Road. Saline County, for example, which ten years ago was roamed over by the buffalo, this year produces a million and a half bushels of wheat. Ellsworth, one hundred miles west of Salina, which, in 1868, was the happy hunting-ground of the Indian, has this year raised from twenty to twenty-five bushels of wheat per acre.

Changes in the Climate.—The Crops.

The rapid climatic changes are converting barren into good arable land, and it is now thought that in five years' time, good crops can be produced at Fort Wallace, 235 miles west of Salina, where the country is now seemingly a desert waste. The long, blue-joint, or prairie grass, is moving westward at the rate of five miles annually in advance of the population. It grows from two to three feet high, and serves to protect the soil from the direct rays of the sun, and after a rain storm, answers as a mulch, in preventing the ground from becoming hard and dry. On one section of land in Elk County, where eight plows were "disabled" in endeavors to break up the ground a few years ago, good crops are now being raised. Although the rainfall has not increased so much as has been generally supposed, it has increased very materially. Rain, falling upon broken ground, remains much longer than when falling on hard, dry soil, so that the extreme dryness experienced ten years ago, is not now felt in Kansas. Should Western Kansas and Eastern Colorado, included in what has hitherto been known as the Great American Desert, be ultimately brought under cultivation, it would certainly be a matter of general interest, as indicating what climatic changes man can accomplish in a sterile land.

The inhabitants of the eastern counties express considerable dissatisfaction because the people coming into the State, push on beyond them. They claim that the impression among them that their counties are burdened down with bonded and other debts, is not borne out by the facts; furthermore, that just as good lands can be purchased in the eastern counties at as cheap, or almost as cheap rates, as can be had in the middle and western counties hundreds of miles further west. Governor Anthony and other prominent men in the State, interested in its welfare, have stated to me that the people of Kansas do not sympathize with any "philanthropic" or other movements in the Eastern and Middle States for transferring a dependent population to Kansas, where there is room only for those who can take care of themselves.

The crops of Kansas have generally shown a fine average yield. The wheat crop has been the largest ever raised in the State. The oats have been good, and potatoes very good. Corn was affected by the dry weather. A large crop of broom corn has been raised this season. The following tables indicate the quantity of Kansas cereals as compared

with last year. The figures for 1877 are official, as likewise are those for this year (1878), furnished me by the Hon. Alfred Gray, Secretary of the State Board of Agriculture, whose well known thoroughness is a sufficient guarantee for their accuracy.

KANSAS CROPS.	1877.	1878.
Wheat	14,316,705 Bush.	32,315,358 Bush.
Corn	103,497,831 "	89,324,971 "
Oats	12,768,488 "	17,411,473 "
Rye	2,528,054 "	2,732,008 "
Barley	1,875,323 "	1,562,793 "

These returns of the crops for this year, are based upon the monthly reports which the county officials are required by law to make to the agricultural authorities of the State. A portion of this correspondence, describing the great Texas Cattle Drive, is given on page 450 of this number.

Science Applied to Farming.—XLVII.

Fish as Food for Animals.

"The cattle at Provincetown feed upon fish with apparently as good relish as upon the best kinds of fodder. We have seen the cows at that place boldly enter the snarf, in pursuit of the offal thrown from the fish-boats on the shore, and masticate and swallow every part but the hardest bones. A Provincetown cow will dissect the head of a cod with wonderful celerity. She places one foot upon a part of it, and with her teeth tears off the skin and gristly parts, and in a few moments nothing is left but the bones. It is said that some cows there. will, when grain and fish are placed before them, eat the whole of the fish before they will touch the grain." *Barnstable (Mass.) Journal, Feb. 7, 1833.*

We have accounts of the feeding of fish to stock in the East, centuries ago. It is a regular practice in northern Norway, where dried codfish are used to piece out the stock of hay that does not suffice for the long winter. In 1856 Prof. Stoeckhardt, of Saxony, received a sample of Norwegian fish-guano, which he fed to a half-year-old pig "which did exceptionally well on this northern food."

Experience of Farmers in Maine.

The same practice prevails on our Atlantic coast, particularly in Maine. The Maine Agricultural reports refer frequently to this use of fish-pomace, or fish-scrap, the material which, when dried and ground, makes fish-guano. Mr. W. D. Dana says:

"Fish pomace, or the residuum of herring after the oil is pressed out, is greedily eaten by sheep, swine, and fowl; and probably pogy [Menhaden] chum would be eaten as well. Smoked alewives and frost fish also furnish a food palatable to cattle. Sheep thrive well, get fat and yield heavier fleeces when fed on this pomace than when fed on anything else produced in this section of the State. Careful and observing farmers who have fed it, assert that it is of equal value with good hay, ton per ton, and that its value for manure is in no degree diminished by passing it through the living mill, and thus reducing it to a much more convenient state for applying. If it could be sufficiently dried, without other substances, to prevent putrefaction, it would form a valuable article of cattle feed in regions from which it is now excluded by the expense of transportation and its own odoriferous nature."

Mr. M. L. Wilder says of his experience in the use of scrap as a food for sheep: "I believe fish offal to be not only cheaper, but much superior to any other kind of provender I have ever used for this purpose. I keep about one hundred sheep, and have fed fish offal to them for the past ten years. The offal is made from herring caught in weirs, salted the same as for smoking, cooked, and the oil pressed out, leaving a pomace for which the sheep are more eager than for grain. For the last three winters I have kept my sheep on threshed straw, with one-half pound of dried fish-pomace per day to each sheep, or one pound of green (as it shrinks one-half in drying), and they came out in the spring in much better condition than when fed on good English hay with corn. I consider the dry pomace worth as much as corn, pound for pound. When I have had enough to give them one-half pound per day, I have found that the weight of the fleeces was increased one-quarter, and not only that, but also the carcass in a like proportion; the weight of the fleeces per head averaging from five to seven pounds."

Why Fish are Nutritious.

Fish and fish refuse consist essentially of flesh, oil or fat, and bone. The fleshy portions, which contain nitrogen, are similar in composition to lean meat and to the albuminoids—gluten, fibrine, etc.—of plants. The fish oils or fats, too, are essentially the same as those of hay, corn, oil-cake and other vegetable foods. The bone contains albuminoid matter; "gristle" is quite digestible and nutri-

tious, and phosphate of lime, which, though greatly in excess of the needs for food, does no harm. The albuminoids and oil are especially valuable in fish, because (1) they are more easily digested than in most vegetable foods; (2) they supply in concentrated forms just what poor foods, such as straw, corn-stalks, and marsh and late-cut upland hay, lack. These latter are inferior to early-cut hay or grass, not merely that they contain less nutritive materials, but especially because they have not enough albuminoids and fats. Hence the utility of feeding oil-cake and cotton-seed meal with poor hay, corn-stalks, and straw. Oil-cake and meal were formerly used for fertilizers, until farmers found they were excellent fodder, and that what was not made into flesh, fat, bone and milk in feeding, was worth more for manure, because in more available forms than before it had been pulverized and decomposed in passing through the animal. There is no reason why the same should not be done with fish refuse, except the difficulty of making it palatable, and this obstacle is not hard to overcome.

Experiments with Fish for Fodder.

The earliest accurate experiments on fish as food for animals that I have seen, are reported by Mr. Lawes, of Rothamsted, England, in 1853. Various foods, including bean, maize, and barley meals, and dried Newfoundland codfish, were tested. Mr. Lawes says: "In the two series.... where we have a comparatively small amount of non-nitrogenous matter consumed, the food consisted, in a large proportion, of the highly nitrogenous codfish; and in both of these cases we had not only a very good proportion of increase to food consumed, but the pigs in these pens were very fat and well ripened, and hence a large proportion of their increase would be real dry substance.... This result is, in itself, interesting; and it may perhaps point to a comparatively greater efficiency in the already animalized protein compounds [albuminoids] supplied in the codfish than in those derived, as in the other cases, from the purely vegetable diets."*

The high cost of grain foods in Europe—farmers there have to look to Russia, India, and America for their supply of oil-cake,—has led the German Experiment Stations to examine the question of the value of animal foods, scraps, dried blood, and fish as a substitute. Numerous feeding trials have been made with sheep and swine, to test the digestibility of dried flesh, blood, and Norwegian fish guano, and their nutritive value, as compared with vegetable foods such as pea-meal, oat-meal, and potatoes. The animals were fed during different periods of two or three weeks each, with different foods and mixtures, and careful weighings made of both food and excrements. Each series occupied several months, and was made with an amount of labor and accuracy that would be simply astonishing to most farmers in this country. Wolff found sheep to digest 92 per cent of the albuminoids, and 97 per cent of the fats of *flesh-meal*, and concluded, with Wildt, that animal albuminoids and fats may serve just as well as vegetable for fodder. From several trials with sheep, Weiske and Kellner conclude that fish-guano may be fed with profit. At first the animals did not relish the fish, but when mixed with oat-meal they accepted and soon got to eating it clear very greedily. They digested 90 per cent of the albuminoids and 76 per cent of the fats of the fish. It is agreed that these animal foods are as nutritious as the most concentrated vegetable foods. A large number of farm trials in different parts of Europe bring the same result. An accurate experiment by Professor Farrington, of the Maine State Agricultural College, leads to like conclusions.

On the whole the testimony is unanimous as to the high value of fish guano as food for sheep and swine. There is no reason why it should not be equally good for neat cattle, particularly young stock. One important element of the profit from such foods is the manure. The transformation of fish by birds into Peruvian guano makes it more soluble, and worth more for manure. Kellner found that the same is true when fish is fed to sheep.

To make meat-scrap, dried blood, or fish most profitable for feeding, the first point is to get a

wholesome product. This can be done by proper preparation. Common salt, or, perhaps, better, German potash salts, would aid to this end, and increase the value of the manure. The next point will be to feed them with poor hay, straw, and corn-stalks, and thus save the better hay for use where it is most needed. By such economizing of fish wastes millions of dollars may be saved to the farmers of the country. W. O. ATWATER.

Wesleyan University, Middletown, Conn.

How to Tell the Age of Sheep.

In buying or in selecting sheep for keeping or fattening, it is important to know their ages; this can be easily and quite accurately determined by

Fig. 1.—3 MONTHS. Fig. 2.—12 TO 18 MONTHS.

examination of the teeth, and there is no other way of getting at the age with any degree of certainty. Sheep, like cattle, have no upper front teeth, but the gum is hardened into a tough pad. The lamb, at birth, shows but two incisor teeth, often none; but in about 25 days the full set of 8 "milk teeth" has appeared, and at 3 months the "dental arch" (the front teeth) is full and round, as in figure 1. Between a year and 18 months the two middle milk teeth are replaced by broad permanent ones, as indicated in figure 2. Towards the age of two years,

Fig. 3.—2 YEARS. Fig. 4.—3 TO 3½ YEARS.

the teeth next on each side of the middle drop out and their place is taken by broad teeth, as shown in figure 3. At this stage the jaw shows four broad teeth in the middle and two narrow ones on each side. Figure 4 shows very nearly how the teeth look at 3 to 3½ years old, there being two more broad teeth, or 6 in all. Now the last remaining

Fig. 5.—FRONT VIEW OF FIGURE 4.

milk teeth are so small as to be hidden behind the broad ones, and scarcely visible, when looking at them on a level and in front (fig. 5). At 4 to 4½ years these last milk nippers are replaced by the permanent ones (fig. 6); but not until 5 years or after do they attain full size. After this age the teeth gradually wear away, and at nine years are much worn, as in figure 7.

There is considerable variation, however, in the teeth, according to breed of the sheep and the way in which they are kept, but a little practice will enable one to estimate their ages quite accurately.

Fig. 6.—4 TO 4½ YEARS. Fig. 7.—9 YEARS.

An illustrated chart has recently been published, giving the ages of the horse, cow, sheep, pig, and dog, that is of great value to farmers, every one of whom might recover its cost many times a year by its use. It is an instructive, attractive and valuable chart to post up in the stable or office.*

More Pleasant Figures to Read.

"We owe a *Thousand Million Dollars* to foreign countries for money borrowed to carry on the war, to build railroads, and for articles imported for use and consumption here," was the statement only three or four years ago, and the actual amount of indebtedness was even greater. At least sixty million dollars had to be sent abroad each year, to pay the interest on this sum. What more pleasant reading, than to learn that, while supporting ourselves, and even reducing the aggregate of home indebtedness, individual, municipal, and national, our people are rapidly wiping out this foreign debt by economy in luxuries and in the expenses of living, etc., and by producing more and more to send to other lands—by increased effort, by developing the agricultural resources of our great country, and by the blessing of Providence in giving us magnificent crops.... In the *American Agriculturist* for September, we showed that during the year ending July 1st, our country exported of its products \$261,744,579 more than we imported; in two years, an excess of \$428,234,596; and in five years, **\$657,218,495**. In our October number, we presented the figures showing that from Aug. 1866, to Aug. 1878, we had reduced our National interest bearing debt, \$571,852,395 (or from \$2,381,530,291 to \$1,809,677,900), and our annual interest payment in the same time, from \$150,977,698 to \$95,181,007, an annual saving of nearly \$56,000,000; and our annual taxation from \$488,274,465, to \$240,753,305, or more than half.

The good work still goes on; our former figures were made up to June 30. We now have the official statistics to Oct. 1st. Exclusive of specie, the exports during September were \$57,924,808, and the imports only \$37,399,541, a gain during the month of over Twenty Million Dollars (\$20,525,267). The total exports from January 1st to October 1st, 1878, were \$533,729,118; the imports during the same time, were only \$324,598,631, a gain in 9 months of **\$208,808,527**. At the same time, the large products of our gold and silver mines are being retained in the country, by so much not only increasing our solid wealth, but adding to the reserve for resumption of specie payments. The yield of the mines for our last fiscal year was about \$94,000,000, or \$46,226,106 of Gold, and \$46,726,214 of Silver. (About \$2,500,000 of gold and \$3,000,000 silver are consumed in the arts and manufactures. The total stock of gold and silver in the country July 1 was estimated at \$332,443,947, an increase of about \$90,000,000 during the year, to which \$26,000,000 was added from the mines from July 1st to October 1st.)

The non-official reports show that the gain is still going on, though temporarily lessened a little in October by the Scotch Bank failure and consequent financial disturbances in Great Britain, which, for the time being, checked orders for breadstuffs. The business is reviving again now. Great Britain has still large requirements for breadstuffs, with extraordinary small supplies to come from Hungary, India, and Australia. From Jan. 1 to Sept. 27, British India exported only 1,193,706 bushels of wheat against 10,485,158 bushels in the same time last year. France is also a large buyer this year, her imports of wheat during September alone being 2,339,520 bushels this year, against 638,824 bushels last year.—The cotton crop is the largest ever produced in this country, and despite the retardation by yellow fever, which has now happily disappeared, the exports in ten weeks from Sept. 1 were this year 493,887 bales against 341,751 bales during the same period in 1877.—

Surely there is a hopeful outlook for all classes. While very high prices for corn and wheat can not be expected, it is satisfactory to learn that there will be a demand, at some price, for all the immense products of the past two harvests, so that the country will be cleared, and a demand exist for the next year's harvest. Our agricultural readers can with hope and confidence lay out their plans during these leisure winter days for putting in a good area of spring crops. Let them not forget that the best paying crops are those in which the largest yield is obtained from the smallest area. We will do our share in showing how this is to be accomplished.

A Nebraska Stock Farm.

Our associate, who is now in the West, thinking it would interest farmers elsewhere to see how those who are occupying the newer States arrange their buildings and lay out their farms, selected as a typical example, the stock farm of T. H. Leavitt, Esq., at Riverside, Nebraska. This seemed to be

home-bred, though all of choice families and pure blood. There are about as many sheep, Cotswolds, beautiful animals; and about 250 head of cattle. Of these, upwards of 50 head are Shorthorns of pure blood, selected with care from noted herds in Canada and various States, from Massachusetts and New York, to Missouri and Colorado. The noble bull, "7th Baron Morley, No. 18,954" (pure Princess), which stands at the head of the herd,

Building material is here somewhat more expensive than at the East, but can hardly be rated high, while labor of all kinds is low. Feed for stock is very low; hay at \$1.25 to \$2.50 per ton; corn, 15 @ 20c. per bushel, and other things in proportion; while the products of the dairy, the stable, and the pens, command very nearly eastern prices. The brief narrative of this farm and the facts we have given, may serve to show that the West has sub-

VIEW OF THE BUILDINGS ON A NEBRASKA STOCK FARM.

so beautifully situated, as well as carefully planned, that he sends a ground plan of a portion of the estate, which will give a better idea of the relative positions of the buildings, yards, etc., than would the general view alone. This view, from sketches and photographs, was taken from a point opposite the lower right-hand corner of the plan. The following is a brief history of the estate, which is situated three miles southwest from Lincoln.

In 1865, thirteen years ago, an enterprising young man from Michigan located on this spot. Within a range of 5 or 6 miles, where now there is a population of well nigh 10,000, about a dozen others had made similar claims of Government Land. At that time, a band of Pawnee Indians, 300 strong, were encamped just west of them, and deer, antelope, wolves and other large game were abundant. Six years later, the property passed into the hands of a Vermont farmer, and the present proprietor is a Massachusetts' man; the original pioneer owner being now a Government officer at Washington. The farm comprises 250 acres. The stock, aside from work teams, consists of about 250 Berkshire swine, some imported, but mostly

and several of the females, were bred in the State of New York. The buildings are substantial and commodious, neat and attractive in style, and arranged and fitted with every convenience for the thorough, economical, and profitable prosecution of the stock business. The product of the dairy for the past season has been about 20,000 lbs. of cheese, of quality which compares favorably with the product of our best eastern factories. The region is

substantial attractions for eastern men and eastern capital, no less than that the East and West have common interests which are worthy of more consideration than we are able to give them in this place.

Time to Select Breeding Stock of Poultry.

—The surest way to get good healthy chicks, and the best eggs for setting, is to select the breeding stock early in the season, before they are mature.

A flock selected in November, and given quarters where they can choose the house or open air at will, growing up together and naturally drifting into productive life, are always found to produce the best progeny, being more even in type and color. With such timely selection, and care in the feeding not to let the stock get too fat, nor on the other hand too poor in flesh, are among the secrets in securing fine chickens. The breeder must have perception enough to know when his fowls are over or under fed. Old and young poultry

PLAN OF THE BUILDINGS, YARDS, ETC., ON THE STOCK FARM OF T. H. LEAVITT, RIVERSIDE, NEBRASKA. The principal buildings are designated. The pens in the piggery open into small yards, which communicate with the larger yards at each side. In front of the barn is a fountain, surrounded by a fence and forming a circular yard for calves.

well settled, highly cultivated, and well stocked. The last wolf about here was killed in 1876. Prairie Chickens, Plover, Quail, Wild Geese, Ducks and Brandt, in their season, are still abundant.

should not be cooped together, as food sufficient to keep the young, growing pullets in a laying condition, would so fatten the old ones that they would lay but little and perhaps not at all.

Among the Farmers.—No. 35.

BY ONE OF THEM.

At the Agricultural Fairs.

The most pleasant fairs are those at which there is a mixed attendance of city and country people. At Elmira, for instance, there was a considerable sprinkling of mechanics and shop people, and of young folks, to whom pigs and poultry, sheep and cattle, mares and colts, as well as many products and implements of every-day farm life, were a genuine curiosity. It was still more so at Waverly, situated as it is within a few minutes ride by the cars of four New Jersey cities, and but half an hour away from New York. Here city folks were by far in the majority, and it was very funny to see how "green" sensible people may sometimes be about things with which they are not familiar. At the Somerset County (N. J.) fair the country people so far outnumbered city folks, that the latter were lost in the crowds of the tillers of the soil with their wives and sweethearts. And I am sure that the beaux whose talk is of cattle, received as many smiles and favors, as those who conversed about the picturesqueness of rural scenes.

Horse Trotting.

The dignified old Agricultural Society of the State of New York is the only one I know of which will not make use of the attractions of a trotting course, and regular trotting matches to "draw a crowd." Everywhere else the trotting course is the principal attraction. I do not like it, but it is claimed that the Societies could not live to hold fairs without it; and certainly the trotting matches, as conducted by many of the Agricultural Societies, have little that is low and immoral about them, while thousands of people are drawn together who not only enjoy the day and one another, but who see and learn much that is very useful and interesting. Hundreds never have time or inclination to stand or sit through a trotting match, with its vexatious delays, disappointments at a favorite's failure to win, and enjoyment of victory. Still, a good many people seem to enjoy it. Let them—the horses certainly enjoy it, the drivers are in a high state of pleasant excitement, while the judges are the only ones that seem not to have a good time, and even they have the satisfaction of sacrificing themselves for the general good. The money that pays the premiums and salaries—if salaries be paid—that cares for the grounds and erects tents and permanent buildings, all, or nearly all, comes from the people who assemble to see the trotting. It is a great deal better for the money thus to come into the treasuries of Agricultural Societies, than to swell the profits of purely racing and trotting associations. [We allow our Contributor to express his views, but we believe these horse-races, sugar-coated with the name of agricultural fairs, are wrong in principle and tendency. They cultivate an unnatural taste for horse-racing that is not healthful. That they are not necessary, is demonstrated by the New York State Fair, always one of the best and most useful held in this country.—EDS.]

How to Control a Fierce Bull

is a problem, the solution of which should be familiar to every farmer's boy. It is an old rule, never to trust a bull, no matter how gentle he may be. We have to trust him sometimes; but if one has the least suspicion that the bull has a notion "to try conclusions" with his keeper, then it is rash not to control him absolutely. A fine Ayrshire bull got the better of his owner and his groom at the New England fair, and was shot. I learned the story from his owner: how that, as he seemed quiet, he was led out into the ring, among others, without his cheek strap, and taking advantage of his freedom from that restraint he used it to his groom's sorrow, and his own destruction.

A cheek strap for a bull is a simple strap of good leather, fastening by a snap into a ring in the bull's nose, passing between his horns, where it is held in place by a strap going around them, and back to a leathern girth, to which it is buckled. The animal is led and handled by a second ring. He

can not get his head to the ground, and is consequently unable to do mischief, and perfectly manageable. I have had occasion a few times to lead a bull of two or three years old through or across the city of New York, and have done so with comparative safety by putting a girth about the body, then attaching a stout cord like a clothes-line to one or both forefeet at the pastern, passing it under the

CHEEK-STRAP FOR BULL.

girth and letting it be held by a man behind, while another lead the bull by a staff. So long as a bull thus encumbered goes straight forward, he can be prevented from running or going fast, for a vigorous pull as he lifts his feet will bring up first one foot and then throw the animal upon his knees. He can, however, turn upon the man who holds the cords, and this disarranges things for a while. But the cheek strap is not liable to any such objection. The bull soon finds out that he is powerless to do evil, and so calms down and behaves himself. There is usually plenty of space in the hole in the septum of the nose to insert a second ring, and the two rings may be left in without inconvenience to the animal. It is represented in the engraving.

Apoplexy in Horses Induced by Fright.

A horse trader came through the village last week and made an exchange with a man who contracts to dig cellars and haul stone, etc., the contractor taking a horse on trial for three days, and agreeing to pay some \$25 to boot. The horse was set to work, and every one noticed how nervously he started at the word, and how hard he pulled. Suddenly he fell back and died. It was a clear case of apoplexy, or a bursting of a blood vessel in the brain. The cause was a mystery until some one, wise in the dark doings of the horse traders, explained it. He says that when these base fellows get in trade a dull, nerveless, lazy horse, they cure him for the time being by taking him into the woods or other secluded spot, and there by whipping and yelling at him, making him pull as if his life depended upon it, followed by such lashings and beatings as puts the poor animal in mortal fear, they prepare him for sale, and warrant him for several days, or leave him on trial for three days, as in this case, well knowing that he will not get over his scare for a week. It sometimes happens that the excitement is too great, and the poor frightened animal drops dead, and is freed from his tormentors. This extremely nervous condition is easily observed, and should always deter one from purchasing. The human brute guilty of such practices should be watched, and if evidence can be obtained hand him over to the tender mercies of some kind-hearted Mr. Bergh, to be dealt with according to law.

Mr. Bergh is tender towards animals, but judicially hard-hearted towards their tormentors. The admirable Society of which he is the head, has done much to make the lives of kind-hearted people comfortable. Looking back a few years, it is easy and painful to remember the poor hard-worked omnibus and ear-horses of New York, with great galls exposed to the air, flies, and rubbing of the harness; and not these alone, but the halt, lame, and sick beasts that were made to do regular work, sometimes falling under their burdens, and often dying in the street under the blows of their drivers. How things are changed! and it is all Mr. Bergh's doings; and though he has doubtless erred sometimes, it has been on the side of mercy to the beasts.

Talks on Farm Crops.—No. 22.

By the Author of "Walks and Talks on the Farm," "Harris on the Pig," etc.

"The truth is, Deacon, we must farm better. I have no heart to talk about farm crops. We must talk more about the preparation of the land,—about draining, cultivation, and manure. There is no money in poor farming."

"There is precious little money in any kind of farming, now a days," replied the Deacon, "we had a good wheat crop this year, but we can get but little for it. Barley brings a high price, and so will potatoes, but what of it? Many farmers did not get 10 bushels of good barley per acre, or 50 bushels of merchantable potatoes. High prices do not help those who have nothing to sell."

"It is the old story" said the Doctor. "Things that are easily got, are worth but little. Potatoes and barley bring a high price this year, because a good crop could not be obtained only on land in the best condition. We say the season was unfavorable. The Hessian fly hurt the barley, and the bugs defoliated the potatoes. And yet you will find on adjoining farms, or sometimes in the same field, a good crop of barley, of 40 bushels per acre, and near by a crop that is hardly worth thrashing; and so with potatoes. Now, the season is the same, the bugs and Hessian fly the same. The only difference is, that the one piece of land has been properly prepared and enriched, and the crop sown or planted at the proper time, and the others not; that is all the difference. And it is not wise to fold your hands and say, 'we had a bad season.' Better say, 'it would have paid me well if I had spent a little more time and labor and money, in making the land dry, clean, mellow, and rich.' What you want is more faith in your business."

"That is the point Doctor," continued I, "you have hit the nail right on the head. Experience and observation, prove that the only farming that pays in the long run, is good farming. I have a field that this year has produced 250 bushels of potatoes per acre. And on either side of it is land that produced less than 50 bushels."

"You have no reason to complain," said the Deacon, "you have the best crop I have seen this year, and at a dollar per bushel, your potatoes will pay you better than any other crop you raised."

"If I had farmed better, I should have found it decidedly profitable. My good crop was on a field that is thoroughly underdrained, and which I manured this spring. And the extra yield of potatoes will pay for all the draining, for the manure, for cultivation, and for the land itself."

"You want to prove," said the Deacon, "that we must drain our land and make more manure or buy artificials. I should agree with you if it was not for the cheap, rich land of the West. Freight are low, and it would seem pretty risky business to spend more money in draining 10 acres of land than we can buy 50 acres for in the West; and then every year spend from \$10 to \$15 an acre for artificial manure. Better 'go West, young man.'"

"No matter where you go," I replied, "you will find that this principle lies at the basis of profitable agriculture. You must get good crops—not only in favorable seasons, but in what we call unfavorable seasons. We must farm better. We recognize the principle in feeding cattle, sheep, and swine. We do not, with these, trust to 'nature.' We provide food for them in winter, and see that all their wants are supplied at all times. We must do the same thing for our crops. I have a private letter from Prof. Shelton, of the Kansas Agricultural College, in which he says: 'Our crops of all kinds are wonderful—surpassing anything I have ever before seen. This afternoon I figured up the yield and cost of a small field of wheat. The yield was a fraction over 41 bushels per acre, and it cost, exclusive of taxes and interest on investment, 30 cents per bushel. Our corn promises equally well. I shall be disappointed if we do not get 1,800 bushels from 25 acres. But prices are very low: wheat 60 cents, corn 18 cents, and oats 15 cents per bushel, and hay only \$2.50 to \$3.00 per ton.' "That crop of wheat in Kansas," said the Dea-

con, "sold for \$24.60 per acre. Here it would have brought \$43, to say nothing of the straw. The difference is over \$19 per acre."

"But you must recollect," remarked Charley, who is somewhat inclined to go West, "that to raise 41 bushels of wheat per acre here, we must underdrain and have our land very clean and rich, and then not get such a crop one year in ten."

"We will not," said I, "discuss this question of whether farming is more profitable at the West than at the East; it depends a good deal on circumstances. No matter where you go, there is little money to be made in poor, ordinary farming. Prof. Shelton figures out a profit of *one hundred per cent* on his wheat crop. But how is it with the farmer who raises only 20 bushels per acre? Prof. Shelton's crop cost \$12.30 an acre, and the *profit* is \$12.30 an acre. If the crop of twenty bushels cost \$10 per acre, the *profits* would be \$2 per acre."

"Yes," added the Doctor, "judging from past experience, in a year or two we should have an unfavorable season, and wheat, instead of selling for 60 cents a bushel in Kansas, will bring \$1.20. In such a year, Prof. Shelton may get only 30 bushels per acre, instead of 41 bushels, and many others instead of getting 20 bushels will get only 10 bushels. In this case, the *profits* from the 10 bushel crop will be \$2.00 per acre, and from the 30 bushel crop \$24 per acre, or twelve times as much."

"And so," said the Doctor, "you are tired of talking about farm *crops*. You think farmers should bestow more thought on the preparation of the land. This may be true, but still it is well to think about particular crops and how to manage them, and what varieties to sow and plant. There are more good farmers in the world than many of us imagine; and let me tell you, that the next ten years will see a mighty advance all along the line. Think of the enormous exportation of farm produce, and above all, of the exportation of cattle, sheep, and hogs. Think of the great quantities of artificial manures that are being used; and the farmer who uses one ton this year, will be likely to use two tons next year, and five tons the year after. This will enable him to farm better and raise and fatten more stock. He will keep better bred animals and feed richer food, and this will give him more and richer manure, and that will make him a richer and happier man. So do not be discouraged. I agree with you fully that we *must* pay more attention to draining and cleaning and enriching the land; but when this is done, we must also give attention to improved herds of animals and improved varieties of plants. Without this, the good farmers who improve the land will not get full returns for their skill and enterprise and labor."

"That is the right doctrine," said the Deacon; "and I do not think the *American Agriculturist* receives sufficient credit for the care it exercises in testing and recommending new varieties of farm crops. I place great reliance on its judgment. Its advocacy of the 'Early Rose' potato, alone, has put millions of dollars in the pockets of farmers. It was the *American Agriculturist* that first induced me to try the 'Peerless,' and though many have condemned it, I feel sure that this variety has been a very profitable one in many sections. Until last year, it was the most productive and profitable kind I raised. The Late Rose that year was decidedly the most profitable. But this year the 'Peerless' again comes to the front."

"I am glad," said the Doctor, "to hear the Deacon say so much for the *American Agriculturist*. Much more—very much more—could be said in grateful acknowledgment of its discriminating judgment in regard to the relative merits of new varieties. It deserves the thanks of every farmer, fruit-grower, and florist in the United States, or for that matter, in every land where the English language is spoken. It is a grand and noble paper—fearless, outspoken, and eminently trustworthy. It condemns the bad and recommends the good."

"I find that this difference in different years, which the Deacon alludes to, is true of other varieties. Last year 'Compton's Surprise' did not do anything like as well as it has this year. The 'Snow-

flake' is also better this year than it was last year, and I do not think there was a rotten potato in the field of this variety, or the 'Early Vermont,' 'Jones' No. 4,' and 'Genesee Co. King.' 'Compton's Surprise' suffered somewhat, and 'Brownell's Beauty' still more. The latter, however, were very large, and yielded well, and after all there was probably not over five per cent of diseased potatoes. They have the advantage, too, when they rot, they rot right through and have done with it! 'Perfection' yielded wonderfully well. This is the first year we raised it, and have not yet tested its quality. 'Jones' No. 4' we have raised for three or four years. I have not yet made up my mind in regard to its value. This year it has done remarkably well for such a poor season. It produced more bushels per acre than any other variety. It is as handsome as the 'Snowflake,' and much more productive, but the tubers are small. One of my men says that years ago we had a variety called 'Thousand in a Hill,' and this reminds him of it. If planting it early on rich land would increase its size, it would be a very profitable variety."

"But of all the varieties we have raised," said Charley, "none are quite equal to 'Genesee Co. King.' There is not a man on the farm but thinks it decidedly the best in yield and quality. It was a pleasure to dig them. They resemble the 'White Peachblow,' but yield three times as much. They are a late variety, grow vigorously, and the bugs do not injure them half as much as they do the 'Snowflake' and other kinds that have smaller vines. We ought to plant all of them next year."

"You manured part of your land, and part not; did the potatoes rot more on the manured land?" asked the Doctor.

"No, not in the least; and I am perfectly satisfied that we must manure our land for potatoes—either with good, rich, well-rotted barn-yard manure, or with artificial fertilizers, or *both*. With both, would probably be the better plan. I would draw out the manure this winter, or very early in the spring, and spread it broadcast on the land, and plow it in. The longer it is exposed spread out on the surface of the land, the better I should like it. Then apply some good artificial manure in the ridge or hill. We must give up the notion that manure rots potatoes. Now that we have to fight the bugs, we must plant potatoes on our best and richest land; plant the best and most vigorous varieties, and take good care of them. There is much money in potatoes, if we can only raise good crops in unfavorable seasons; and this we can do if we select good land, manure it well, plant early, and take good care of the crop."

About Agricultural Fairs.

The writer of "Among the Farmers" apologizes for, and almost falls in with, those who think that fairs can not be conducted successfully without the usual horse trot. Yet he quotes the N. Y. State Agricultural Society as not recognizing their necessity, though it holds one of the most successful fairs—in all that constitutes success at an agricultural fair—held in the country. Another example is

The Orange County Fair.

Until this year the Orange County (N. Y.) Agricultural Society had thought trotting to be the thing to draw the crowd needed to pay their expenses. This year, however, it voted to hold the fair at a place where there was no track, and trotting had no place on the bills. The result was, *larger receipts* than in several previous years, and a more successful exhibition in every respect. This fair also illustrated some other facts in regard to fair-grounds in general. As no trotting was to be held, a long track was unnecessary. A field of 25 acres was rented, which was bounded only by a low stone wall. On one part, where the ground was smooth, a short track was staked out with no expense for grading, for showing carriage and draft horses, colts and stallions, and saddle and walking horses. On the other portion, tents and temporary hoard structures sufficed for the show of implements, poultry, fruits, and field products, flowers and domestic articles, and pens for the live-stock. A few special police

around the borders of the field kept out intruders. This was all. The Society owns no expensive grounds or buildings, and so has no debt on its shoulders to encumber free action. The small field, which the no-trotting allowed, was convenient to the highway, and so compact that one could visit every part in a short time and not be weary and foot-sore from the long walks so often necessary on a fair-ground where the exhibit must cover much space, as a sexton scatters a small congregation in a large church, to give an appearance of fullness. The rent of the field, and the expense for tents, and police, etc., were less than the interest would be on the cost of large grounds with track, buildings, and high board fences. The grounds being open to the view of the public from the highway, wore a bright and inviting look that must have drawn many who would not otherwise have attended. The fair was such a success, that it was at once voted to follow the same course next year.

A New Departure in Premiums.

It is the usual custom to offer small premiums of \$1 to \$2 for "the best cow," "the best three sheep," etc., of each of several breeds, and natives or grades. So it was at the Orange County Fair, until this year a "Friend of Agriculture" offered several special premiums, among them the following: "For the best herd of 5 Ayrshire cows, \$10.00," and the same for Dutch or Holsteins, and for natives or grades. "For the best flock of 10 or more ewe sheep, \$10.00; particular attention to be paid to mutton qualities as well as to wool bearing." "For the best acre of wheat harvested the present year, \$6.00; competitors to exhibit a bushel of the average product of the field, and to furnish a sworn statement as to cost, yield, and methods of cultivation." "For the best collection of implements exhibited and kept for sale by any dealer within the county, \$15.00; second ditto, \$10.00." The donor argued that any man might have one 1st prize cow in an otherwise poor herd, while it is for the interest of agriculture to encourage the keeping and exhibition of good *herds*. For sheep the same argument holds; and it was desired to create the impression that mutton production is as important as wool in sheep husbandry. The amount offered was concentrated in a few things which were of most importance to the agriculture of the county, instead of dividing the money among an endless number of comparative trifles. Milk records and pedigrees were asked for in connection with the cows exhibited, on the ground that the cow's history and performances were as important as her looks. The result of those special offers was the calling out of 156 cows—far exceeding the usual number—and about 60 sheep. The total amount of these premiums was only \$90, but they were distributed in such a way as to be influential in *what* constituted a large portion of the exhibition.

Many believe it desirable to have a great variety of premiums, so as to enlist and interest the largest possible number of persons, and to encourage small farmers. Others aim for ample permanent grounds and buildings. We describe this particular fair, because it presents the other side of the subject, and may be worthy of the consideration of the hundreds of Societies that will soon be making plans for the next campaign. Of course modifications will be required to suit the needs of any particular locality.

What Underdraining Did.

One of my neighbors made an experiment in underdraining seven years ago, with very satisfactory results, which are worthy of record. The soil was originally good, but had been much neglected for many years, and yielded small profit under the old style of management. The lot selected for drainage comprised eleven acres, the lowest part of it a swale, sloping to the north, and the east and west sides heavy moist land that yielded weeds and coarse grasses. It was estimated to be worth *not over five dollars an acre* when taken in hand. A main drain of six-inch tile was put through this field, four feet deep, with lateral drains of two-inch tile, twenty-five feet apart and two and a half feet deep. The whole cost was about \$50 an acre, or

\$550 for the eleven acres. This included everything—opening ditches, cartage, tile, laying tile, and superintendence. As the fall was good, there was a complete drainage of the lot, the water passing off into the ditch in an adjoining field. These drains were put down seven years ago. The first year after the drainage, the land was plowed, manured with 350 loads of stable and yard-manure, and sowed with corn for fodder, and seeded with timothy in the fall. The crop of hay the first year was two tons to the acre. Allowing it to be worth \$10 a ton standing, there is seven per cent interest on the \$55 invested in land and drains, and some return of capital. There has been no manure applied to the land, except that on a few small patches, where the seed failed to catch, there was one application of liquid manure. There has been a steady increase of grass until this year, when 39 tons, or

Fig. 1.

3½ tons to the acre, were taken from the field. The hay was well cured, and weighed on platform scales, so there is no guess-work about the yield. With the same estimate for the hay, this is a return of \$35 upon the original cost of \$55 for land and drainage. As there has been no outlay for manure in six years, with a steady increase of productivity, it follows that the drainage has been gradually improving the land. A layer of soil and subsoil some two feet in thickness, formerly so saturated with water as to be useless, is now penetrated by the air, by the rains, and by the roots of grasses in search of their appropriate food. As the experiment shows, rich stores of plant-food became available every year, and with proper handling may prove inexhaustible. In such a heavy growth of grass, there must be a corresponding increase of roots, and the sod must be growing richer. The experiment is a strong argument for the draining of swales. CONNECTICUT.

[Our correspondent writes that the aftermath has not been cut from this field, or the meadow grazed, since the drainage, and infers that this has considerable to do with the large crops obtained. But he wisely adds that it is uncertain how much of the gain is due to the improved condition of the soil from drainage, and how much to the non-cutting of the aftermath. We have in mind a hill farm

Fig. 2.—TROUGH FOR WEANING CALVES.

that cuts 250 tons of hay per year from only 80 acres in grass. Two crops are removed from nearly or quite all of this area, and three crops from a considerable portion. The owner asserts that he could not obtain so much from a single cutting, and he had to begin, of course, with one crop. In the experiment described above by "Connecticut," we declare in favor of the drainage as being the factor which gave the increase.—EDITORS.]

Hints and Helps for Farmers.

SHOE FOR INTERFERING HORSES.—"A Subscriber" sends a sketch (from which we have made the engraving, fig. 1) of a shoe which he has devised and tried successfully to prevent horses from interfering. It is made twice as wide and heavy on the outside as on the inside. To equalize the wear, the inner and lighter portion of the shoe is made of steel.

A CALF-FEEDING TROUGH.—"B. S.," Washington, Ind., sends a plan of an old device, but none

the less valuable, for feeding milk to calves, and for teaching them to drink milk while they are being weaned. It consists of a wooden trough (fig. 2), at the bottom of which is fastened a loop of leather

Fig. 3.—AN OPEN FEEDING SHED.

one inch wide and six inches long. The calf learns to suck at this piece of leather, and will soon leave it and drink the milk. Calves three days old will use this device. It is worth trying.

AN OPEN SHED FOR FEEDING.—A feeding trough in a yard, which can be covered to keep out snow or rain, is a desirable thing, and many devices have been contrived for the purpose, most of which are too costly. We give herewith a method of constructing a covered feeding trough, which may be made very cheaply of the rough materials to be had on every farm. A sufficient number of stout posts are set firmly in the ground, extending about 10

Fig. 4.—TO PROTECT THE EYES.

feet above the surface. They should be about 6 feet apart and in a straight line, and a plate fastened to their tops. A pair of rafters supported by braces, as shown in figure 3, is fitted to each post. A light roof of laths is laid, and covered with bark, straw, corn-stalks, or coarse hay. Strips are fastened from one brace to another, and laths or split poles nailed to them, about 6 inches apart, to make a feed-rack. A feed-trough for grain or roots is built upon each side. For sheep, the shed and rack may be made only 8 feet high at the peak, and the eaves 4 feet from the ground,—giving better shelter.

A SHADE FOR HORSES' EYES.—The most frequent cause of weak eyes in horses is a badly arranged stable. Foul gases irritate and inflame the tender membranes of the eye and head, and horses brought from dark stables into bright sun-light, or on to glittering snow, are dazzled and blinded. The existing weakness or irritation is intensified, and the poor animal suffers unsuspected torments. The remedy is to purify the stable and give it sufficient light, shaded by blinds, from before and behind the horse, or from both sides, avoiding a light from only the front, rear, or one side light. A shade for weak or inflamed eyes may be constructed by fastening wires to the bridle and covering it with oiled cloth in the manner represented at figure 4. Thus

Fig. 1.—CHARCOAL KILN.

a soft, subdued light reaches the eyes, while the horse can still see the ground immediately before him. It will be a timely job to prepare such a shade now, for use when the snow comes.

Kilns for Burning Charcoal.

"Charcoal iron" is a valued product in the market, because the metal is free from sulphur and other impurities which are imparted by mineral coal and render the iron brittle and difficult to work; charcoal iron is tough, and furnishes the best material for fine manufactures. Car wheels and similar parts of heavy machinery, which are subjected to a like strain, are made from this iron.

Fig. 2.

Thus it is that charcoal burning is usually connected with iron-working where there is abundance of wood. The "pit" manufacture of charcoal was described in the *American Agriculturist*, Feb., 1860, but it is more economical to make it in permanent kilns, even for sale in the market, the cost of the kiln coal being 50 per cent cheaper than the pit coal, and the waste much less. The kilns may be conical, or in the shape of an elongated parallelogram, and are built of common hard brick. A round kiln (fig. 1) 12 feet across, would be 16 feet to the top of the dome. The wall is built up perpendicularly for about half the height, when it is drawn in gradually, requiring no supporting centers, until the opening is about 4 feet in diameter. This is closed by a cast-iron plate. The kiln is strengthened by broad iron half bands, or two tiers of them drawn up tightly by screws working in flanges, as shown at figure 2. Several bricks are left loose in

Fig. 3.—FOR BURNING CHARCOAL ON LARGE SCALE.

the lower courses, and others near the top, to be removed to make openings to admit air for draft, and for ventilation. There is a cast-iron, double door on the ground level, and one at the upper part for putting in the wood. Figure 3 shows a long kiln of greater capacity, which has plain brick walls, covered with a light arch of brick, and supported by a frame of timber posts, which are set in the ground. The doors and ventilating holes are similar to those of the conical kiln.

Boys on the Farm.

It is a proud day when the average boy gets on his first pair of boots and trudges to school by the side of his older sister. He does not care any longer to take her hand. The leading strings are cut. But this early ambition to be a man is entirely eclipsed, when he has taken charge of his first pair of steers, and started for the fair. Has he not raised them from their mother's milk up, broken them to the yoke and to the cart, taught them to pull and to back, to haw and to gee, and to obey his word of command? They are his workmanship, the evidence of his skill in subduing brute muscle, and making it do his bidding. He is going up to the exhibition to display the fruits of his triumph, and, as he hopes, to wear the laurels of victory. He is no longer merely a spectator upon the fair grounds, but an exhibitor of stock and an entertainer of spectators. There is unquestionably a difference of native tastes in boys. Some have a natural aptitude to one calling and some to another, but most men have their callings determined by

early circumstances; sometimes by incidents so trivial, that they have hardly a place in memory. It is not difficult generally for a father, who loves the farm, to determine the calling of his children. If he makes it a business of thrift, and provides comfortably for his family, they will respect the calling. If he is discouraged and continually shifting his work, or his home, they will not be likely to make tillers of the soil. But if he conducts the farm upon business principles—makes it a machine for coining money—and providing home comforts, they will be ready to invest in it. One can hardly begin too early with his boys to incline them to the calling that is to give them bread, and the means of their future usefulness. If the boy is to be a farmer, he must begin to have a personal interest and venture in farming while he is yet a boy. Filial affection, in a happy home, is a very strong motive to industry and fidelity, but it does not shape a boy's plans for life like an investment of his own brains and muscles in his daily work. He should have crops and animals, not only that he can "call" his own, but that are his own, to keep, to enjoy, and to sell for his own pleasure and profit. The trusts may be small at first, but they should be absolute, and let him have his own experience of success and failure in managing them. Let him manage poultry, a lamb, a calf, or a colt, and exhibit his own stock at the fairs. We notice with great satisfaction the increasing attention paid to the boys at the fall fairs. Boys did some of the best work at a recent plowing match at one of our fairs. One, a boy of fourteen, held the plow and drove his own team, and made as good a seed bed as his older competitors. These premiums for boy's work, are in the right direction, and should be carefully studied in making up the lists for next year. Make room for the boys.

A Well-Cellar.

In parts of Pennsylvania we have seen a cellar so connected with a well as to considerably lower its temperature. The arrangement might be used to advantage elsewhere. It is represented in the engraving. A cellar is dug about 3 feet from the

WELL AND CELLAR CONNECTED.

well, as deep as may be convenient, and an opening made between them through a brick arch, the mouth of which is covered with coarse wire netting. A slab of stone is placed near the opening, upon which butter is set to cool. A shelf, or shelves, may be put up around the cellar. It is separated from the room above by a tight floor, and connected with it by a trap-door and stairs. The cellar walls should be of stone or brick, whitewashed. The upper room serves as a store-room for clean articles,

A Method of Setting Fence Posts.

Where the soil is soft, loose and free from stone, fence posts may be set by driving, more easily and firmly than by digging holes for them. A method of driving is shown in the annexed engraving. A wagon is loaded with posts, and furnished with a movable stage, upon which the person who drives the posts may stand when first starting them. The engraving needs no verbal description except that the hook which holds the stage in place, is made of strap iron, and fastened to the floor of the stage. One man holds the posts upright, while the other

EASY METHOD OF SETTING POSTS.

drives them. When a post is driven home, the wagon is moved on to the next place, and the operation repeated. This is an easy, rapid and economical manner of setting posts for any kind of fence.

A Tennessee Barn.

A Tennessee subscriber sends the plan of a barn he is building, which we reproduce, with a few improvements, in the engraving. He writes: "I am not able to build an expensive barn, and have had to study how to obtain the most convenience for the least money. Just now labor and material are very cheap, and I think that the barn can be built for an outlay of \$250, by furnishing some timber myself, of which I have plenty. I wish to thank you for your remarks on painting out-buildings, especially as to trimmings. They suit my case."—The main barn is 30 x 40 ft., posts 20 ft. A floor for a loft is put in, 8 ft. from the first floor, over the horse stalls, granary, and tool room, and 11 ft. over the drive-way to admit threshers, etc. Double doors open on opposite sides, a small door at foot of stairs, and windows as shown. At *T* is the tool-room; *G*, the granary; *H*, the horse stalls; and at *W*, a well. The cattle shed, *D*, is 20 x 25 ft., with 16 ft. posts, and a loft for hay, into which a door opens from the head of the barn stairs. This shed may be open in the rear, for that section, or a partition may be put up behind the cattle stanchions at a slight cost. A passage-way, 2½ feet wide, runs in front of the stanchions for convenience in feeding, and familiarizing and gentling the cattle. On the front and south side of this shed is the manure-yard, and a place for the cattle to run if desired. Our correspondent locates a compost heap at *M*, which is wholly or in part under cover. A door under the stairs is convenient for removing the droppings of the horses, and a trench behind their stalls leads the liquids to the manure-heap. It is thought best to have the horses face the barn floor, that they may be more familiar with the people, and for convenience in feeding. It is quite as important to have a well planned barn as a well planned house; in both cases proper forethought will save many steps in doing the daily

work. Not only the number of animals to be provided for modify the plan of the barn, but the nature of the land must be considered in designing the building; hence a great variety of plans are desirable, that one intending to build may combine such features of each as suit his needs and surroundings.

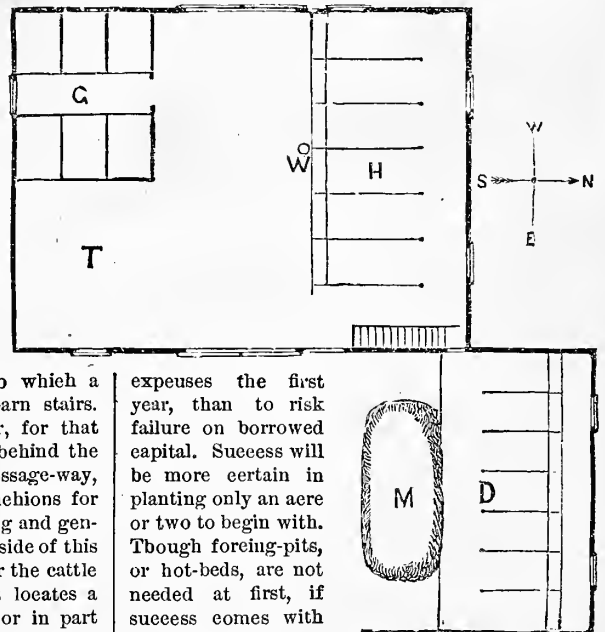

A Mechanic Turning Farmer.

We are asked to lay out a plan for a farmer in the following circumstances: He owns and lives on a small hill farm of about 40 acres, located within 25 miles of a large Eastern city, and has two boys in his family, one of whom is interested in the farm, the other not. The land is somewhat rocky, and not over fertile, but the soil is light and warm, and will produce early crops. Aside from the city market, there are several large manufacturing villages within easy reach. The owner has but little money capital. He has lived on the farm for 20 years, but has always worked at his trade of box-maker. He is tired of the confinement, and now that his son is developing a taste for farm work, his own natural love for the soil is re-awakened, and he seeks advice.

The location and the soil are well fitted for growing vegetables and small fruits for the neighboring villages. Like many other country towns, these are largely supplied with vegetables, even late in the season, from the surplus stock of the city market, which is often several days old, partially wilted, and of quite inferior quality. Now if

our correspondent has sufficient experience, energy, and determination to look after the cultivation and marketing of his crops, we know of nothing which he can undertake with a better hope of moderate success, than raising those vegetables, the value of which consists in their freshness, such as early peas, sweet corn, string beans, and others. A strawberry bed may be made the source of considerable income; and this, if successful, will naturally lead to the cultivation of various other small fruits.

A beginning can be made in this line on a small scale, without any necessity for much capital, aside from labor and careful attention. Avoid getting into debt. It is better to produce only enough to pay

PLAN OF TENNESSEE BARN.

expenses the first year, than to risk failure on borrowed capital. Success will be more certain in planting only an acre or two to begin with. Though foreing-pits, or hot-beds, are not needed at first, if success comes with experience, there is time enough to enlarge by adding these and other facilities. A few simple rules only are necessary; but these are imperative: Select ground sloping toward the south or east, and more or less sheltered either by the slopes or by trees. Drain thoroughly if needed. Pulverize the soil by repeated plowing and harrowing. Enrich at the rate of six cords or more of

good, well decomposed stable-manure per acre; if this costs over \$5 per cord, it will probably be cheaper to buy chemical fertilizers in part, unless the soil is pretty heavy and compact, in which case the stable manure will be best, to loosen its texture. Do not scatter the manure for one acre over two, as it will produce more profit on the smaller area. Cultivate thoroughly and often, and allow no weeds to grow. As soon as the vegetables are in proper condition for table use, market them; and make sure to offer for sale only the best; for these prices are easily obtained. Henderson's "Gardening for Profit" will afford much useful information.

The farm is too small for almost any other kind of farming, but is large enough and well adapted to vegetables in location and soil. One good cow to supply the family with milk, is enough; hogs may be kept at a profit for making manure, and utilizing the waste. To succeed in farming, as in anything else, one must have energy, patience, and perseverance; without these he need not expect success, and "success" in cases like the above, with limited facilities, does not mean large profits, but only a good living, independence, and happiness.

Cooking Food for Stock.

As regularly as the seasons, come the queries regarding the latest knowledge on the subject of cooking food for cattle; whether the practice will pay; why it is not more generally adopted, etc., etc. A few simple principles lie at the base of the practice, which should be understood in order to judge fairly in the matter. First—Cooking must not be confounded with mere moistening by steam. Cooking, proper, is only accomplished at a heat nearly or quite equal to that of boiling water, or of steam at that temperature. This degree of heat breaks up the food particles, especially the starchy portion, and renders a considerable amount digestible which otherwise might pass through the animal and be practically wasted. In order to secure the proper temperature in the cooking-box, there must be an engine-boiler, or steam generator of sufficient capacity to keep the box full of hot steam; and the box itself must be so constructed as to hold the steam when received. Cooking, under such circumstances, is said to render coarse food, such as ripe and badly cured hay, old corn-stalks, straw, etc., from one-fourth to one-third more digestible—i. e., a saving of \$2.50 to \$3.33 on every \$10 worth of such material.

These simple facts are so imperfectly understood that much of the so-called "steamed" food is only moistened with warm vapor, which merely softens the tissues of the fodder, without rendering it appreciably more digestible. It is claimed by those who have tried it that cooking is profitable for a herd large enough (say 50 and upward) to make the gain more than equal the cost of the labor, and interest on the investment in apparatus, etc. Mere moistening does not pay, as nothing is accomplished by it which does not take place within the animal. There are small cooking steamers, but for operations on a large scale, perhaps the most economical steam generator is the boiler of a 2 to 4 horse-power engine, which at the same time furnishes power for cutting the fodder preparatory to steaming, for threshing, wood sawing, etc. A simple calculation will decide the question for each particular case.

As stated above, hard, coarse fodder, such as over-ripe hay, straw, corn-stalks, etc., is rendered more digestible by cooking. A large part of the nutritious portion of such material is so bound up in the tissues or cells of the plant that the digestive organs of the animal have little effect upon it; but under the influence of the cooking the hard tissues are broken up, and the otherwise unavailable food is rendered available. Experience, experiment, and investigation show, however, that properly cured hay,—grass cut when green and succulent, and simply cured, not dried—fodder corn, Hungarian grass and similar fodder, roots and finely ground grain, are but little if any benefited by the process of cooking; for these are already very nearly or quite in the natural condition, and suited to the animal's capacity for digestion. A cow whose or-

ganization has become so artificial as to be unable to digest the food provided by nature, had best be sold to some man who keeps a large herd, and believes in and practices cooking; he will find that it pays in her case. No one would think of steaming grass or any green fodder, because his observation and experience tell him that nature has made the cow's stomach to digest such food; and experience tells the same story about properly cured fodder.

The obvious lesson from these facts, is, that cooking of coarse fodder pays, when there is enough of such material to be utilized, and the herd of cattle is a large one; that mere moistening such feed does not pay; and that all fodder should be put into the barns in a condition most nearly resembling its state when it is most palatable and nutritious to the animals feeding upon it while growing.

Lucern or Alfalfa in Vermont.

Among the unsettled questions in our agriculture is: can Lucern or Alfalfa be profitably grown in the Northern States, east of the Mississippi? There are differing opinions, and evidence on either side is welcome. Mr. Albert Chapman, of Middlebury, Vt., having been struck with the productiveness of Lucern (or as it is always called there, Alfalfa,) in California, procured seed from thence, and sowed it in 1877, in several patches on different parts of his land. It passed through last winter uninjured, and this past season he has cut from one of his patches three crops, and at the time of his writing, Oct. 28th, there was a fourth crop ready for cutting. From this crop he sent a specimen; the stalk was 23 inches high, and thickly furnished with foliage. Mr. C. estimates that each of his four crops was worth much more than any one crop of Red Clover produced from the same area of land in his county this year. Two of the other patches yielded three crops each, and on the other only one crop was cut, the succeeding growth being allowed to go to seed. Mr. C. attributes his success, in the first place, to the character of his land, which has a deep and porous subsoil, that allows the long roots of the plant to penetrate deeply. He thinks that where there is a hard, compact subsoil, the plant will not succeed. He regards as the second reason for his success, the sowing of California seed. If not all, the majority of the trials with Lucern have been with European seed. He learned in California that seed from Chili was always successful, while that from Europe, though from the same species, did not produce hardy plants. To those disposed to experiment with the plant, Mr. C. gives the caution to not sow the seed until all danger of late frosts is past, for though quite hardy when established, even a light frost in the first few weeks from the seed, is fatal to it. This is a very satisfactory account, as it points out conditions, especially that relating to the soil, which probably have not been observed in former experiments. That Lucern is a most valuable foliage plant where it can be successfully grown, seems well established.

A Simple System of Farm Accounts.

(FIRST PAPER.)

A Farmer who keeps no accounts, works in the dark. He knows not which part of his farm or labor pays, and which is a loss, and runs the risk of having the proceeds of his profitable labor offset by avoidable losses. He does not know whether this or that management is the better. With a plain and simply kept account book, he may know where he makes money and where he loses, and, in the words of a noted business man, he may "cut short his losses, and let his profits run on." The first thing in beginning to keep accounts is to make a rough map or plot of the farm, and to name or number each field, as indicated in the annexed plan, to be modified to suit any circumstances. The only necessary point is the recognition of each field, and the expenditures and receipts from it. Two books are required. The complicated systems of farm accounts in books prepared for the purpose, are bothersome, and in the end usually come

to nothing, because they are not suited to the majority of cases, and are not used. The better plan is, for each one to make his own method, and use but two books—a daily record of events and transactions, and a ledger. The daily record is a most useful book, and if kept with regularity, in a few years becomes a history of the farm, if not of the family, and of the seasons and weather. A small book, 8 inches by 5, with 300 ruled pages, but without money columns, will serve for many years. These books are sold very cheaply now, but it will pay to have one of good paper. One can be made by

PLAN OF A FARM.

stitching together note paper or folded foolscap. One of the greatest benefits of keeping accounts is, that every thing becomes reduced to a system, and the most careless or inexperienced farmer soon becomes methodical and observant (if he persevere). In the record is noted the events of each day—more particularly the business transactions. The following lines will serve as a sample of how these may be entered. It will be better to state more particulars, to note the weather, etc., etc., but such simple records are always of very great value:

- 1873.
- Oct. 1. Finished building spring house; cost \$28.84.
 " 2. Hired P. G., at \$22.00 per month, to clear swamps.
 " 4. Finished sowing rye in No. 5. *32 bush. seed, \$19.20.
 " 5. Paid D. P. \$4.50, one week's wages. 7 doz. eggs, sold to B. Bros., at 13c.....91c.
 " 7. Received from W. A. C., proceeds of sweet corn, from No. 5.....\$181.16
 " 9. Paid D. D. \$600 for 12 cows. Finished cutting corn in No. 5, 8 days' labor. Began plowing No. 3.
 " 10. Plowing No. 3. Paid for 2 tons of bran.....\$32
 " 11. Shipped 60 bushels potatoes to W. A. C.
 " 12. Cash for milk sold this week, \$32.50.—Began pulling mangels for cows. 10 bushels used.
 " 14. Finished cistern; cost \$30.25. 20 bushels mangels.
 " 15. Finished plowing No. 3. Sowed 16 bushels seed.*
 " 16. Finished harrowing No. 3. Husking corn, ½ day.
 " 17. 9 bushels wheat to mill. 5 doz. eggs to B. Bros.

In this manner each day's transactions are noted, so that at the end of the week or month, the entries may be transferred to the ledger. It is unnecessary to do more than give a clear clue to what has been done, so that each charge or credit may be made out distinctly, and as these should be entered in the ledger each week, something may be trusted to memory. It is also unnecessary to be over particular in small matters, or to be so precise that it may be troublesome to enter some items. The chief thing is to know what is done so nearly that the final result can be reached as closely as may be. Many persons who begin, soon get hopelessly mixed up by trying to be too particular at the start. After a beginning is once made, and facility acquired, then one may be as exact as he pleases. But there are many things in farm accounts where one must "give and take," and such small irregularities are unavoidable and will about balance each other in the general result. For example, if one goes to mill with a grist, the time occupied need not be charged to the flour or to the house expenses with the flour; nor need the skim milk fed to pigs or calves be charged in accounts unless it is desired to know the exact cost of each item of work or production. But the grain used for feeding cows, fattening cattle, sheep, pigs, and poultry, should be measured out and charged to each, as it is very important to know what profit or loss is made from each kind of stock; and for each crop raised, the cost of labor expended upon it, and the value of the seed, and manures, should be noted, and the crop measured and its value calculated.

*The quantity of seed is large, being 4 bushels per acre, as it was sown thickly for cutting for cows in the spring.

Plan of a Wood Shed.

Where fire wood is used, a shed for its storage and preparation is a necessary addition to the homestead. It may be of any desired size, but 24 feet long and 12 to 16 feet wide, are good average dimensions.

PLAN OF A WOOD SHED.

A convenient arrangement is shown in the engraving: at *a*, are the kitchen steps, at *b*, is a saw table, with a circular saw driven by the horse power *c*. Outside of the door, *d*, is the wood pile from which the sticks are brought through the doorway to the person sawing, who stands at *x*. As the wood is sawn, it is thrown to a heap close by, to be afterwards split and stored away in compact tiers for use.

Sheep-Yard and Ram-Pen.

Where a valuable ram, or a large flock of ewes is kept, it is advisable to have the ram confined during

SHEEP-YARD AND RAM-PEN.

the day-time, and admit him to the ewes only at night; or to turn into his yard, those ewes that are ready. A wether kept with the ewes will soon single out those which are in season, and direct the shepherd's attention to them. Under this method a full grown ram will be sufficient for 50 to 70 ewes, if he is kept in a vigorous condition by good feeding; the lambing season may be spread over one or two months, and the time of each ewe be accurately known. A plan of a yard and pens for this system is illustrated herewith. The ewe shed is at *a*, their yard at *b*; the ram's pen at *c*, and his yard at *d*. Dotted lines indicate gates.

Stock-Feeding for Profit.

"What Shall Eastern Farmers Do to Compete with the West?"

A considerable portion of the beef sold in the great markets of England is produced from animals brought from Scotland, and fattened in English pastures and feeding stalls. Scotch farmers breed animals well adapted for fattening, and at two to three years of age drive them southward and sell them to English farmers who "finish" them for market. Many of these are spayed heifers which make as good beef as steers—by some considered better. These animals are fattened on pasture feed, straw, turnips, and oil-cake, which makes a complete and profitable beef-producing food. The only thing purchased is the oil-cake (or Indian corn) which, as shown last month, leaves much of its value in the manure-heap. The result is two valuable money products: grain and beef, and a constantly increasing fertility of the soil, which is augmented by using purchased superphosphates on the turnips. A similar practice has prevailed more or less in our Eastern States. Young cattle, produced at a low price further West, are purchased and fed a few months, to finish them off for market, and with very satisfactory results. A few cases are re-

ported of parties fattening a large number in this way for the European dead meat trade. There is good reason to suppose that this practice may be profitably extended, and perhaps be a partial solution of the problem: "What can Eastern farmers do in competition with the West?" as it really makes each section help the other. At present, the animals which are fitted for beef on the Western ranches and shipped East, to be slaughtered on arrival, would make far better beef if fed for a month or two within 100 miles of the Eastern markets. The Eastern farmer has better facilities for this part of the work than his Western co-worker, and, being nearer, can get the product into market in better condition. No animal is really fit for beef for some weeks after a long railroad journey. Under this mutual arrangement, the Western farmer should (to develop the business) breed beef animals by the use of Shorthorn or Hereford bulls, and perhaps will in time introduce the Aberdeen or other Scotch polled cattle; but he is relieved of the work of the expensive feeding for which the ranch has but poor facilities. The Eastern farmer will produce a large amount of the best manure for the enrichment of grain and turnip land; he can purchase Indian corn and oil-cake at a low price, and will have wheat, barley, and beef to sell.

The most important point to be considered in this business is to attempt to fatten only that class of animals whose breeding and form are adapted to rapid laying on of flesh. We know of a farmer who believed in this idea, but he purchased a lot of "scalawag" cows and scrawny "stags." They were well fed and gained somewhat during the winter, but so little, that when sold they brought no more than their first cost; and though the food was not wasted, its valuable parts being mostly in the manure heap, yet the time and labor expended were all thrown away. Another acquaintance, within 100 miles of the above, purchased 60 grade Shorthorns at a fair price, and made a good profit from the investment. Fattening beef animals pays; but trying to fatten inferior animals is a waste of energy, time, and labor. The animals should be selected with special reference to the rapidity with which they will fatten; to the quality of the beef, fineness of bone, compactness of body, and small amount of offal which the carcass will yield.

Burning Green Wood greatly Wasteful.

Water in passing into vapor absorbs and hides nearly 1,000 degrees of heat. A cord of green wood produces just as much heat as a cord of the same wood dry. In burning the dry wood we get nearly all the heat, but in burning the same wood green, from one-half to three-fourths of the heat produced goes off latent and useless in the evaporating sap or water. Chemistry shows this, and why, very plainly. Therefore get the winter's wood for fuel or kindlings, and let it be seasoning, as soon as possible, and put it under cover in time to be dry when used. It will of course season or dry much faster when split fine.... A solid foot of green elm wood weighs 60 to 65 lbs., of which 30 to 35 lbs. is sap or water. As ordinarily piled up, if we allow half of a cord to be lost in the spaces between the sticks, we still have a weight of about two tons to the cord, of which fully one ton is water or sap. Such wood affords very little useful heat; it goes off in the ton of sap. The great saving of hauling it home dry is evident—as we get the same amount of real fuel for half the team work. Beech wood loses one-eighth to one-fifth its weight in drying; oak, one-quarter to two-fifths.

Excellent Protection against Rusting.

For farm implements of all kinds, having metal surfaces exposed, for knives and forks, and other household apparatus, indeed for all metals likely to be injured by oxidation or "rusting," we know of no simpler, more effective application than that furnished to the *American Agriculturist* by the late Prof. Olmsted, author of Olmsted's Natural Philosophy, etc. He used it on air-pumps, telescopes,

and various other apparatus.—Take any quantity of good lard, and to every half pound or so, add of common resin ("rosin") an amount about equal to half the size of an egg or less—a little more or less is of no consequence. Melt them slowly together, stirring as they cool. Apply this with a cloth or otherwise, just enough to give a thin coating to the metal surface to be protected. It can be wiped off nearly clean from surfaces where it will be undesirable, as in the case of knives and forks, etc. The resin prevents rancidity, and the mixture excludes the ready access of air and moisture. A fresh application may be needed when the coating is washed off by the friction of beating storms or otherwise. This single recipe will be worth many dollars to any one in the long run. There was talk of patenting it, at one time, but Prof. Olmsted gave it to us to be published for the general public good.

Some Facts About Lime.

Several correspondents ask for information concerning the use of lime on land, and all of them contain evidence of several commonly accepted but false theories. First, lime is not plant-food; or rather it is so common in most soils, and incidentally comprises so large a portion of many fertilizers, that its application as plant-food is unnecessary. We have not seen a soil analysis from which this constituent was missing, and there is nearly always considerable of it present in available form; all true superphosphates are composed of one-fourth part or more of lime, and it is prominent in Peruvian and fish guano, in nearly or quite all manufactured fertilizers, as well as in barn-yard manure.

Lime, however, has an important effect aside from its action as plant-food. Freshly burned lime (known as "caustic lime" and "quicklime") has a strong affinity for carbonic acid, so that when it and organic matter (which always contains a large proportion of carbonic acid) are mixed together, the lime and carbonic acid unite, promoting the decomposition of the organic matter. Newly "slaked lime"—which is lime united with water—has an effect similar to quicklime, though slower, and hence is better for farm use. Fresh, undecomposed organic substances, especially dung, contain the most valuable ingredient of plant-food, nitrogen, in its simple form; but it is very soon changed into ammonia, which in turn unites at once with carbonic acid. Then when lime is brought in contact with the mass, it at once combines with the carbonic acid, and the valuable ammonia escapes and is lost. When, however, the lime is applied before the ammonia is formed, the nitrogen is oxidized to nitric acid, which unites with the lime to produce nitrate of lime, and the nitrogen is saved. Therefore, lime may be used in stables and house privies, or in composting carcasses of dead animals, to advantage; but if mixed with manure a day or two old, the result is a loss of valuable material. The above also shows why, when lime is put into a compost, it has such beneficial action in hastening decomposition, and why it is necessary to use plenty of fresh earth to absorb the escaping ammonia.

Free acids, and those in easily decomposable substances, are also readily taken up by lime, and many injurious compounds, as of iron in wet lands, are rendered harmless. In some soils insoluble silicates, of potash, etc., accumulate; but the action of lime will break up these combinations and set the potash free for use as plant-food.

The above statements show that the main action of lime in the soil is in making available plant-food what was before unavailable. Therefore, while it may increase the crop-yield of poor land, it will tend to bring about its early exhaustion, unless plant-food is added. In heavy clay soils, the above mentioned chemical reactions of lime, destroys their tenacity and makes them friable and porous. Soils containing a large proportion of organic matter are benefited by its application. Wet lands are less benefited by lime than the same when drained, on account of the water. Light soils are improved by it when accompanied by a liberal application of muck or other organic matter; clays should also have the same treatment. As the best effects of

lime are not apparent until the second year, it is best to apply it early in the fall; then, if the land is not rich enough, manure or other fertilizer put on the following spring will help produce a good crop, other conditions being equal. The amount used is from 10 to 50 bushels per acre, according to circumstances, the condition of the soil, etc.

Chicken Pox.

Many of the descriptions of diseases of poultry, so nearly correspond with the symptoms of what is given as "Chicken Pox" in Feleh's book on "Breeding and Management of Poultry," that we make an abstract of the chapter:

Symptoms.—A raised and warty eruption of the comb, face, and wattles, yellowish white in color. When the scabs are removed, these warty substances resemble a bunch of tiny spiles set into the flesh, and the wounds produced bleed profusely.

Treatment.—Remove the scabs and bathe in hot water and Carbolic Acid. When the bleeding ceases apply Citrine Ointment, which will dry the warts to hard black scabs; let these remain for 60 to 70 hours, when by removing them, they will take away the little white "roots" which are from one-sixteenth to one-fourth of an inch in length.

Each morning for four days, give a pill made as follows: Table-spoonful common Flour; one of Flowers of Sulphur; tea-spoonful of Cayenne Pepper; 35 to 28 drops "Fowler's Solution," (Arsenite of Potash,) and milk enough to mould the compound into 20 pills. Dissolve four grains of Quinine in two-thirds of a pint of milk, giving one-half in the morning, and the balance at evening. Feed, while treating, on boiled onions and rice mixed with oatmeal. If the disease attacks the eye and so prevents feeding, make the food into pellets, which, if dipped in milk, and the bird held, will slip down the throat readily. If the sulphur acts too powerfully upon the bowels, scald the milk given, which will cause it to act in the proper direction. Feed vegetables, sulphur, and iron, to the flock to check the spread of the disease, and cleanse the house in which it appears, as thoroughly as the "Board of Health" would a house that had been visited by small pox.

Hornless Cattle for American Breeding and Foreign Markets.

In several former numbers we have written of the Polled Cattle, which are now attracting considerable attention abroad. Mr. J. H. Wallace has been among them of late, and his investigations lead him to the belief that their general introduction among beef producers in this country, would be a desirable improvement. Horns were put upon cattle for self-defence, but in their domesticated state there is no good use for such weapons—indeed they are a positive detriment. In the freedom of prairie and farm life, horns occupy a neutral position, and are of small account, except as ornaments and handles to lead gentle cows by, on the one hand; and as boy and dog

tossers, women frighteners, bar and gate openers, skin tearers and horse embowellers, on the other. As soon as these horns, however, attached to half as many valuable beef animals, are collected in a crowded cattle ear, they at once become property destroyers, and fit subjects for the action of the Prevention of Cruelty to Animals Society. In the long journey from their Western pastures to Eastern markets, the cattle are sorely worried and often purposely, or unintentionally, badly gored by their neighbor's horns. Doubtless some of the falling off in condition during their travels is due to the rough handling of the numerous sharp and powerful weapons by ignorant heads; especially must this be the case with the half-tamed Texan

even excelling the Shorthorns at many shows and in market, it must be admitted that these cattle deserve the attention of our breeders and beef producers. The result of the animals getting to market in a better condition after a long railroad or ocean journey, would be larger prices for the better beef, and more of it to sell—usually a cogent argument with men who are looking after the profits.

Experiments in "Cultivating" Wheat.

It is as reasonable to believe that grain crops should be benefited by cultivation as that potatoes, corn, cabbages, and other crops should be. Hoeing

wheat is not an uncommon practice in Europe, and farmers in this country have begun it with marked success. We are favored by Mr. Travis, of Michigan, with samples of wheat grown with and without cultivation, on adjoining plots, and cut from equal spaces of ground. We give an accurate engraving from drawings of the bunches themselves, which are cut in two to save space. Reports are also at hand of a committee of neighboring farmers, under whose supervision the experiments were made. 68 lbs. of seed per acre were sown in drills 16 inches apart, and 90 lbs. per acre in drills 8 inches apart, Sept. 8, 1877, on sod ground plowed Sept. 1st. That in 16-inch drills was cultivated with the Travis wheat-hoe, once in the fall, and twice the next spring; the other was not cultivated. The wheat was examined during growth, by the committee, and harvested in their presence. According to their report, the wheat in the 16-inch drills did not lodge or crinkle down, while that in the 8-in. drills did so badly, (probably to some extent the effect of

SHOWING THE DIFFERENCE BETWEEN CULTIVATED WHEAT AND UNCULTIVATED.

cattle, whose wildness renders their long horns unusually troublesome when crowded into rail-cars.

On shipboard, the horns are a source of trouble, even more apparent than it is in railroad travel. Here the cattle are tied up in twos, in boxes just large enough for them to stand, but without room to lie down. In the animal's efforts to rest, the horns and halters frequently become entangled, resulting in injury and worry to each of the box-fellows; and when one does lie down his frantic struggles to rise are sure to cause hooking and ripping, as his neighbor has no place to stand except partially over him. Every one knows that fretting and discomfort, and slight injuries even, invariably result in a falling off in flesh, and an unhealthy state of the body, and the horns of the cattle are very frequently an inciting cause of this condition.

To remedy this defect we would not do as the Irish farmers did when it was first found that hornless cattle brought a higher price in the English markets: they stripped back the skin over the heads of the young calves, and removed the just starting horns. Perhaps the remark of a farmer, that "a horn was a mighty convenient handle to lead a cow by," and that "a mooley cow would slip through a halter mighty slick," are serious objections to some, but why any more so than as applied to a horse? When to the quality of having no horns, is added that of being excellent beef animals, as the Angus or Aberdeen Polled Cattle are,

the Hessian fly). The average yield was 69½ per cent greater in the 16-inch drills than in the 8-inch. Where in some of the 16-inch drills the quantity of seed was only 3 pecks per acre, the stand was as thick as where 64 lbs. per acre were sown. The weights of 3 samples of each sowing, cut from equal spaces of ground, and with equal conditions in every respect except cultivation, quantity of seed and width of drill, are given as follows:

Cut from equal spaces.	16 inch drills, cultivated.	8 inch drills, not cultivated.
No. 1 sample weighed.....	3 lb. 4 oz.	2 lb. 0 oz.
No. 2	3 lb. 2 oz.	1 lb. 9 oz.
No. 3	2 lb. 10 oz.	1 lb. 12 oz.
Total weight.....	9 lb. 0 oz.	5 lb. 5 oz.

The number of heads in the samples were:

Cut from equal spaces.	16 inch drills, cultivated.	8 inch drills, not cultivated.
No. 1 sample had.....	564 heads.	320 heads.
No. 2	526 heads.	381 heads.
No. 3	453 heads.	338 heads.
Total.....	1,541 heads.	1,039 heads.

The larger growth of straw in the samples from the 16-inch drills was also conspicuous. These results are not especially wonderful when we consider the already well known beneficial influence of cultivation upon grain crops. This long-needed improvement in our agriculture has already made an impression upon farmers in widely separated parts of the country, and has resulted so favorably as to indicate that the cultivation of wheat will ere long become a very general and profitable practice.

The Scarlet Monkey-Flower.

(*Mimulus cardinalis*.)

"Monkey-flower" is neither an elegant name, nor is it descriptive for our plant. The genus was named *Mimulus* by Linnæus, because the corolla in some species has a remote resemblance to a grinning face, and while some authors suppose that he took the name from the Greek for ape, others think it was from the Latin for mime, or mimic; at all events the name has been translated into Monkey-flower too long for us to try to alter it. In the At-

lantic States we have two native species of *Mimulus*, but their pale-purplish flowers are not showy; in Michigan and westward there is a yellow-flowered one; and still further west, the number of species increases, until on the Pacific coast they become so numerous as to number about 25. Probably the best known *Mimulus* is *M. moschatus*, the "Musk-plant," so often abbreviated to "Musk," that many suppose the drug with all-powerful odor, some call it perfume, to be from this vegetable, instead of being unpleasantly animal. The Scarlet Monkey-flower, a native of Oregon and California, has been in cultivation for nearly half a century, but, like many other good things, has been pushed aside by newer comers. We saw it in its wild state many years ago, but never happened to cultivate it until last year. The plant was unintentionally left out last fall, and, as the succeeding winter was unusually mild, it came up last spring with great vigor, and has all summer given a continuous bloom, which has not ceased up to the time we write—Oct. 25th. It can not be relied upon as quite hardy, and it is safer to make new plants from cuttings to keep over the winter in the greenhouse. In its native localities the plant is two to four feet high, but in cultivation is rarely over a foot, and, as

it branches freely, is about as broad as tall. The engraving of the upper end of a branch of the natural size, shows its general appearance. There is, to us, something very pleasing in the aspect of this plant; the leaves, being clothed with somewhat sticky, minute hairs, have a pale and tender green, against which the flowers show in striking contrast; the color of the flowers is a most peculiar scarlet; it is bright and lively, without being intense. In Europe, where it is more cultivated than with us, several varieties have been obtained with flowers ranging from orange to dark-reddish purple. The stigma of this flower (the terminal por-

SCARLET MONKEY-FLOWER.—(*Mimulus cardinalis*.)

GRACEFUL SUNFLOWER.—(*Helianthus orgyalis*.)

tion of the pistil, which receives the pollen) is very sensitive. Instead of a blunt end or knob, as in most flowers, the stigma consists of two egg-shaped plates, as seen in the engraving; these spread apart when the flower is in "full blow," but whenever pollen falls upon the inner surface of these plates, they suddenly close; they are so irritable that the same movement takes place when they are touched by a small splinter, or any other hard substance.

The Graceful Sunflower.

(*Helianthus orgyalis*.)

Those whose knowledge of Sunflowers is confined to the common annual species—the Sunflower—can hardly conceive of a graceful one. Some plants appear to be associated with certain surroundings and to belong to shiftless, "ne'er do weel" people. The dwelling of such is often surrounded by a dilapidated fence, within which Sunflowers and "Love-lies-bleeding" suggest that even in a house where old hats and rags supply the place of window-panes, there is some one who has a love for flowers, however coarse they may be. But all Sunflowers are not coarse, and while we admit that

"The Graceful Sunflower"—which is not at all inappropriate. We had known this species for several years, but had not especially noticed its beauty until we saw the past autumn, at the Cambridge Botanic Garden, a fine clump of it, 10 or 12 feet high, where it was contrasted with a large number of other species of Sunflower, and easily outshone them all. Later we saw it in the herbaceous perennial grounds of Woolson & Co., Passaic, N. J., where, with the coarser, but even more abundant flowering *Helianthus Maximilliani*, it made a fine show. The plant is perennial; a well established root will throw up a cluster of a dozen or more stems which reach far above a "man's height," being from 8 to 12 feet in good soil; they bear an abundance of leaves quite unlike those of the ordinary Sunflower, being sessile (without a leaf-stalk), about 6 inches long, and not over an inch wide. The flowers (properly heads of flowers) are about 3 inches across, and upon long stalks; the showy portion, or rays, being of a lively, cheerful yellow. For clumps upon a large lawn this is a most effective plant, and from its great height it may be used for the center of ornamental groups of bold plants, as it is without the coarseness that in herbaceous plants usually accompanies size, and it

lantic States we have two native species of *Mimulus*, but their pale-purplish flowers are not showy; in Michigan and westward there is a yellow-flowered one; and still further west, the number of species increases, until on the Pacific coast they become so numerous as to number about 25. Probably the best known *Mimulus* is *M. moschatus*, the "Musk-plant," so often abbreviated to "Musk," that many suppose the drug with all-powerful odor, some call it perfume, to be from this vegetable, instead of being unpleasantly animal. The Scarlet Monkey-flower, a native of Oregon and California, has been in cultivation for nearly half a century, but, like many other good things, has been pushed aside by newer comers. We saw it in its wild state many years ago, but never happened to cultivate it until last year. The plant was unintentionally left out last fall, and, as the succeeding winter was unusually mild, it came up last spring with great vigor, and has all summer given a continuous bloom, which has not ceased up to the time we write—Oct. 25th. It can not be relied upon as quite hardy, and it is safer to make new plants from cuttings to keep over the winter in the greenhouse. In its native localities the plant is two to four feet high, but in cultivation is rarely over a foot, and, as

only needs to be known to be valued in proper situations. That we may not be alone in our commendation of this Sunflower, we add that Vilmoren (*Fleurs de Plaine Terre*) says: "This plant, from its majestic and picturesque habit, is particularly suited to ornamentation in landscape gardening; employed with discretion, it will produce excellent effects, especially when used in masses on lawns, or planted near bodies of water." Mr. Robinson says "a tall, graceful, willow-like herb. * * * The tips of the shoots for a length of 15 inches or so, cut off and placed in water in-doors, are as ornamental as the most graceful or delicate young Palm or *Dracæna*." We infer that this applies to the use of the graceful foliage before the flowers open. The plant is a native of Kansas and Arkansas, and blooms in August and later, and is quite hardy.

Fixtures for Window Plants.

Window boxes, those intended to hold the soil in which the plants are to grow, have been described in earlier numbers, but those who keep their plants in pots, will find a box exceedingly useful. The pots being placed in this and surrounded by sand, or what we think preferable, sphagnum or peat moss. The use of a box will prevent much litter, which is to some very neat house-keepers a sufficient objection to keeping any house plants. If the plants must be moved away from the window for safety in an unusually cold night, or for other reason, the box allows this to be done with very little trouble. A still greater

Fig. 1.

advantage is, that it checks undue evaporation from the surface of the pots, and makes watering less frequently necessary. If the window has a deep sill, the box may sit upon that; otherwise it should be on legs with casters. The box may be of pine, securely put together, or of any ornamental wood.

In describing, some time ago, a window box for holding the soil, we suggested that oil-cloth carpeting of some neat pattern, made a covering that at a little distance could not be told from expensive tiles. Whatever the box may be, it should be lined with zinc. The pots will be of various heights, and in arranging them in the box, the tops should all be brought up to the same level, by standing them on blocks or small inverted empty pots, or whatever will serve the purpose. The moss is to be first thoroughly dampened and then squeezed in the hands; it is then to be packed in by degrees

Fig. 1.

around the pots, using a stick to press it down where the spaces are too narrow for the hands. The pots should be far enough below the edge of the box, to allow of a thin layer over them and the earth they contain. Sand may be used in a similar manner, but it has no advantages over moss, while it is much heavier. In that most excellent work on window gardening, "Winter Greenhouses at Home," the author, the Rev. Doct. E. A. Johnson, shows how he produced his fine effects with the most simple materials, and among other contrivances, are home-made brackets for supporting pots. Where the window has deep jambs the space may be utilized by suspending pots at the sides, and if these contain drooping or trailing plants, the effect is very pleasing. Figure 1 shows how a bracket is made from stout wire, brass in this case being the best. It will be seen that it is of one piece; the horizontal arm that holds the ring is double, and this portion should be neatly and closely wound with fine copper wire. The triangular portion at the bottom is to keep the whole steady by resting against the wall; this part may be circular or any other form that may be desired. Figure 2 shows the bracket suspended and in use.

A French Garden Fence.

Our correspondent "H." writes from Paris: It is the custom in France, in both city and country, either to build grand houses in the form of a hollow square, with a court in the center, or to surround them with high walls like a fort. Every Frenchman's house is in fact his "castle." Visitors thus miss seeing the prettiest parts of Paris. Once in a while a gate is opened, and one takes in a passing glance of a small earthly paradise,—flowers and fountains, shady walks, and white statues, a palace of wrought stone; the heavy gates swing together once more, and leave only a dingy gloomy wall, the shadow of which falls half way across the street. Once in a while an exception is found, and I inclose sketch of an open iron fence, mounted on a foundation of stone and mortar, through which I recently looked with great pleasure, upon the flower garden and country home of a gentleman in Chaumes. The wall and fence are shown from the street side. The foliage indicated is ivy, neatly trained and trimmed; the open spaces are at a con-

A GARDEN FENCE IN CHAUMES, FRANCE.

venient height for passers-by to look in. On the inside, the stone work is entirely covered with ivy.

Forest Tree Planting—The Seeds.

Much that is very useful has been written about Forest Tree Planting, but the articles for the most part do not go into those practical details that are necessary, especially for the inexperienced, to secure success. While some forest trees may be raised as readily as a hill of corn, this is by no means the case with all. Certain trees that when three or five years old are among the hardiest, are, during their first year, quite as "miffy" as some greenhouse plants, and their culture in this early state actually requires more care than that of a Rose or Geranium. The care required is not of a kind that any intelligent person can not give, but whoever would raise trees from seed, must know that it is required, and how to supply it. Leaving the treatment of young plants until later, when we come to seed sowing, we at the present consider an earlier step, and one upon which success depends as much as on any subsequent one—the proper preservation of the seeds during winter, or from the time of gathering to that of sowing. Tree seeds present a great variety in size and other characteristics; between the soft, flattened scale of the Catalpa seed, up to the large, hard-shelled Black Walnut, there is a wide difference, and while both are seeds, the treatment proper for one would result in the loss of the other. While a few forest-tree seeds may be kept without any more care than that given to ordinary garden seeds, the majority require special treatment to preserve their vitality. It does not seem to be generally known that some seeds ripen in early summer and must be sown at once; these come up in a few

days, the young trees grow rapidly and ripen their wood in preparation for winter all in a few months. The principal trees, the seeds of which behave in this manner, are: the Elms, and the Silver or White, and the Red Maples—other Maples ripening seeds in October. Of course, seeds of these trees are not usually kept by seedsmen, though some of them contract to deliver them as soon as ready. They should be sown as soon after they fall as possible. The principal seeds kept without any special care, beyond storing them in a cool, dry place, are: Ailanthus, Catalpa, Honey Locust, Locust, and Osage Orange; when not for sale, both kinds of Locust are better if left in the pods until wanted for sowing. Many tree seeds if allowed to become quite dry, will either not germinate at all, or will remain in the ground dormant the first year and not come up until the second spring. To prevent drying, many seeds are kept in sand, and when the nature of a seed in this respect is not known, it is safer to preserve it in this manner. Sand for this purpose should not be wet, but damp; the condition in which it is dug from a bank is the proper degree of moisture. The bulk of sand should be at least equal to that of the seeds; and where, as in the case of Magnolia seeds, there is a pulpy coat, more may be used. The seeds, mixed with sand, should be stored in a cool place; being moist, a moderate warmth will cause germination, which is to be avoided; as a general thing, freezing will do no harm. The forays of rats and mice are to be guarded against. The common seeds kept in sand, are: the Sugar and other Maples, except those above named, Box Elder, Ash, Linden, Oaks, Chestnuts, Wild Cherry, Beech, Birches, Hickories, Mountain Ash, Tulip Tree, Walnut, etc. Large quantities of Hickories, Black Walnuts, and Butternuts are preserved in heaps in the open ground, the piles being carefully covered with sods, or in the absence of these, straw, and over these, three or four inches of well packed earth, the heaps being of such a shape and so finished as to shed rain.

Seeds of Conifers, usually called Evergreens, though the Larch and Southern Cypress belong here and are deciduous, present some variety. The cones with thin scales, such as White Pine, the Firs, Larches, etc., usually open readily, or will do so when dried in the sun, or by a gentle heat. When the seeds drop spontaneously, they are to be kept like ordinary seeds; if they will remain in the cones, it is better to allow them to do so until wanted for sowing. The cones of some pines require long drying before they will open; Europeans obtain the seeds from the Cluster, Stone, and other pines that open with difficulty, by hurrying the cones in a sandy place for several weeks; the scales then open readily, and the seed, swollen by the commencement of germination, are sown at once. Red Cedar seeds do not germinate until the second year; these are mixed with an equal bulk of sand, put into a box, and buried in a place where they will not become dry, and sown the second spring.

The Cyclamen as a Window Plant.

Among the less cultivated plants in window gardening is the Cyclamen. When we say, the Cyclamen, we refer to the varieties of *Cyclamen Persicum*, of which there are many. It is especially useful in window culture, as the leaves are of themselves beautiful, and the plant would be worth growing for these if it did not flower. The so-called bulb of Cyclamen is really a much depressed stem, flatter than the flattest of flat-turnips, producing roots from the lower surface, and leaves and flowers from the upper. There are three ways of getting a start with Cyclamens; to raise them from seed, to buy imported bulbs, and to get plants from the florists who have grown them from seed. It is out of the season, to talk now about starting the plants from seed, but they may be had from the other two sources. Imported bulbs are shrivelled and flabby, but soon recover if pressed well down upon the surface of a potful of good soil. They do not need to be planted, *i. e.*, buried at all—merely pressed down firmly; be sure to put them in right side up; the top shows small buds, or scars of former leaves. They will soon absorb moisture, and

become plump, roots will strike from the lower surface, and leaves, followed by buds, from the upper surface. Florists who make a specialty of the Cyclamen are usually careful about their seeds, and one is more likely to get plants that have large flowers from them, than to buy imported bulbs. The plants need no special care beyond that required by other window plants; they will continue for a long time to throw up their quaint, knowing-looking flowers, and when these are done with, the foliage will make it worthy of the place it occupies.

The White Grub and Its Ways.

Last August, in Notes for the "Orchard and Garden," p. 325, a brief account was given of the destruction of several acres of lawn. After that was written we visited the gentleman referred to, and examined that portion of the lawn that had not been re-seeded, and saw the men at work removing the old turf and picking up grubs by the bush! Since then we have received many letters complaining of the work of the grub—some having lost their strawberry plants, others their flowering plants, others their grass—indeed, it makes little difference what the plant may be, for we have known them to cut off the roots of young apple-trees as large as one's finger. These letters, as a whole, show that the writers, if they know what the grub is, have very imperfect ideas of its ways—or modes of life. The first step towards a successful combat is to know the strength and the tactics of the enemy, and though we gave a quite full account of the insect several years ago, our correspondence shows that the subject needs to be presented anew. We find that otherwise intelligent persons do not understand the changes which insects undergo. Not so very long ago a gentleman brought us some beetles—perfect insects—and insisted that they changed into something else, and no argument or assertion would convince him to the contrary. In brief, the changes of insects are always in one direction; we have first the *egg*, then the *larva* (the grub, maggot, caterpillar, or "worm" state); in this condition it makes its growth, which requires all the way from a few weeks to a few years. When full-grown, the larva forms a *pupa* or chrysalis, usually becoming dormant, and in due time it bursts its covering, and comes out a *perfect insect*—as a beetle, butterfly, fly, or whatever its kind. The creature has then completed its career—it does not "turn into" anything, but it lays eggs, and thus the series begins anew.

Fig. 1.—BUG.

Fig. 2.—GRUB.

This being the routine, let us apply it to the White Grub. This pest is the larva of the beetle (shown in fig. 1) *Lechnosterna fusca*, well known as May-bug, June-bug, and Dor-bug; they find their way into houses in early summer, being attracted by the light. The female beetle lays her eggs in the earth; the young grubs (larvæ) are hatched from these, and go about to find their food. But little is known of their history for the first year; no special damage is traced to them, and it is supposed that they live on small root fibres, the loss of which is not noticed. In their second year they make their presence felt; they appear then to work just below the surface, and as already stated devour almost every root or other vegetable substance they find. At this time they are of the shape of fig. 2; when full-grown, somewhat larger. The body is of a dirty white color, the head is brownish. In the spring of the third year, the grub having made its full growth, it goes into the chrysalis state, and in May or June comes out as a beetle. The perfect insect, or beetle,

is also destructive; it collects upon fruit and other trees and devours their foliage. The beetles seem to be quiet in the day-time, but in the evening are very busy; they pair, lay eggs, and the mischief continues. While there are some beetles every year from scattered grubs, the great crop for any particular locality appears once in three years, and one who has observed the year in which they abound, will know when to look for the ravages of the grub. Some think that the White Grub is brought to their gardens in the manure, which is a mistake; the Manure Grub, though of about the same general appearance, belongs to a very different insect, and the two have but little in common. With this brief review of the habits of the White Grub, we will leave the methods that have been proposed for destroying it to be given another month.

Multiplying Strawberry Plants.

With a new and rare variety of Strawberry, it is desirable to multiply it as rapidly as possible. Not only does the nurseryman wish to do this, as a matter of profit, but the amateur who has invested in a few high-priced plants would increase these sufficiently to make a productive bed as soon as may be. Ordinarily, the runners are left to take care of themselves, and it sometimes happens that many fail to strike root; when the soil is too dry, or the plants are in a bleak place, and whipped about by strong winds, there will be many failures. With scarce kinds it will pay to secure a plant from each runner—or rather from each bud on every runner, which may be done by fastening them in place with a bent or forked twig, or by laying a clod of earth on the runner. Where the failure is from drouth, the soil should be mulched with cut straw, and watered after the runners have been fastened down; cut straw is more convenient than long, for this use, as it may be more readily worked in among the old and young plants. Our old horticultural friend, Sam'l Miller, the originator of the "Martha" and other grapes, writes us from Sedalia, Mo., that owing to an excessive drouth last summer his runners could not take root; he picked off the buds—or young plants without roots—at the ends of the runners, and packed them in damp moss. In a few days roots were emitted, when the little plants were set out in beds, shaded for a time, and they made a satisfactory growth. When the Agriculturist Strawberry first came out, a cultivator of our acquaintance followed a similar plan. When cold weather came, his few plants had many runners that had not taken root; these would be lost, if left as they were, so he gathered them and set them out in a cold-frame; the next spring they were well rooted plants ready for sale or planting.

Winter Protection.—Probably more plants are killed by too much protection than by the want of any covering. Some plants, like the strawberry, are perfectly hardy, yet we advise covering them, not so much to shield them from the cold, as to prevent the frequent freezing and thawing of the soil; such protection should be mainly around, and but little upon the plants, and it is better to not put it on at all until the ground has actually frozen. Shrubs just on the border between tender and hardy were formerly completely bundled up with straw, and if they were evergreens, were often smothered to death, between which and freezing there is little choice. One of the most efficient methods of protecting shrubs of this kind, where the material is available, is to procure boughs of cedar or other evergreen, and set these in the ground close to the bush or young tree to be protected. In the absence of evergreens we have succeeded well by placing naked branches or brush around the half hardy plants, and working in straw among them. The object is to ward off severe winds, to give partial shade and to modify sudden changes of temperature, yet, at the same time, to allow a full circulation of air. Hardy herbaceous plants bloom all the stronger for being covered in winter; for this purpose, leaves serve an excellent purpose. When first put on, they are liable to be blown about; sprinkle a little earth over them.

THE HOUSEHOLD.

For other Household Items see "Basket" pages.

How Common Lamps Waste Light.

Did it ever occur to the reader, that most of the common lamps actually waste one-half or more of all the light produced, and are therefore doubly expensive? The flame gives off rays from its surface; but if we half cover the flame, half of the rays are intercepted and lost. This is just what is done in a majority of lamps. Figure 1 shows this. The metal cap, *a*, partly covers the flame; only the portion that rises above *a* gives out light to the room. In several of the lamps now made, this loss is saved by omitting the metal cap, and having the glass chimney set down below the bottom of the flame, as in figures 2 and 3. Such an arrangement is equivalent to saving half the expense of oil.—The Argand principle is of great utility. This is an arrangement for having a current of air pass

Fig. 1.

Fig. 2.

up through the center of a circular flame, furnishing oxygen to its interior. The combustion is much more intense, and the light correspondingly greater.

BY FAITH ROCHESTER.

Warm Underclothes for Children.

The cool days that come now, more and more wintry in their suggestions, set mothers to thinking about the winter clothing of the family. Let no thoughtlessness or negligence hinder the preparation of warm under-garments, especially for the children. We used to think that little boys had much the advantage of little girls, in having warmer and more equal clothing over their whole bodies. But the fashion of short trousers leaves their legs below the knees no better protected than those of little girls—unless, indeed, they are more likely to be provided with long under-drawers. Many fashionably-dressed little boys are not so provided for. Through ignorance or indifference, their mothers sacrifice future health and manly beauty to present prettiness, and in this unreasonable and unkind manner, the majority of little girls are treated. No one can tell how much this has to do with the general ill-health of women. The children are supposed to be growing "tough," but it is often the case that the vitality is too much drawn upon and the constitution gradually undermined, so that many children who seem to be enduring all things wonderfully, are really among those who "die in the toughening," though the death is long postponed and approaches gradually at last. Make the under-garments of flannel or fleecy cotton flannel, and let them cover the body from neck to wrists and ankles. They may be made all in one

Fig. 3.

piece, or in two pieces, as preferred. For young children it is often more convenient to have the lower garments made separate from the upper, and buttoned to them. But the whole garment is easiest made and managed for most children, much

Fig. 1.—INTERIOR OF MENNONITE KITCHEN.

like the long night-drawers. The legs should gore down to the ankles inside the stockings by both an inner and outer seam. The one on the inside of the leg should be left open a few inches to lap over smoothly under the stocking. It should always reach down inside the shoe-top. After this garment has been put on the child, there comes next a stout waist with buttons around the bottom, to which are attached the dress-drawers (whether of white cotton or of colored flannel) and the petticoat. The latter may be basted strongly to the waist for the reason, if both are colored, seldom needing washing. To the side buttons of this waist (under the arms) are buttoned the stocking supporters or garters, either those patented and bought at the shops, or home-made garters—strips of elastic tape with button holes in the wide cloth binding at each end. One end of this garter buttons at the waist, the other fastens on a button upon the side of the stocking outside the leg. Then comes the dress. If all button behind, you can dress and undress the child very quickly after the shoes and stockings are taken off. Unbutton all of the garments behind, and slip them all off together, and replace the set of day garments by a warm well-aired night-gown. We mostly use soft thick factory cloth (or unbleached muslin), and I suppose other poor folks do the same, but flannel for winter is to be preferred, especially for little ones apt to get uncovered in bed. During the night the set of day garments may be placed so as to be well aired in the inside, without separating them, and in the morning the child can slip them on all together with ease. Perhaps I have told all this be-

Fig. 2.—PLAN OF MENNONITE HOUSE.—(A, Chimney; B, Cooking; C, Washing Ranges.)

fore, but I see more and more how little is known or thought by mothers, about the healthful dressing of children in cold weather, and I hardly think I need apologize for returning to the subject.

Sunny Rooms.

I told a neighbor, lately, that the chief objection I had to a house under consideration as our future residence, was that I feared the sun would not shine into the rooms enough to suit me. She laughed as though that was a new idea to her, and quite whimsical. The blinds on the house were not objectionable, as I should leave them wide open, except on rare occasions. But the wide verandas on the east and south sides, would totally exclude the friendly sunbeams from the common sitting room. Even in summer I should not like that, as there are many cool days when sunshine is far better than a fire. My neighbor said that it always made her feel nervous to have the sun shine directly into her rooms. Now sunshine is one of the best remedies for nervousness, but I understood my neighbor to mean that the prying sunshine searching out every speck of dust and tiny cobweb before concealed by habitual shade, made her feel uneasy. Moreover, the colors of the carpet must be preserved, and sunshine fades them. And so my neighbor pays the doctor for her medicine instead of

taking it as a free gift from Heaven in the bright sunshine and pure air—for I think she dreads air as much as sunshine, except when she goes out doors occasionally to get them. I like a broad piazza or generous porches about my house, but I want my windows free from even too much curtain. Unless in hot weather, when almost anything ails you, and you feel disinclined to out door exercise, the best thing you can do is to sit down in the broad smile of a sunny window and let the sunbeams put new life into you. If your feet are cold, the sun will warm them more thoroughly and permanently than a fire, especially if you take off your shoes and put your feet on a stool or chair in the full sunshine. For neuralgia I know nothing better, in connection with fasting from one or two meals, than to lie in the full sunshine, all but the top of your head, which may be protected; cover up warm if the room is cold, but let everything about your body be loose and well aired.

Bread Pancakes.

For those who have milk, a convenient way to use up old bread is, to make it into pancakes. This is a good way to use sour bread also, as a trifle more soda than the sour milk requires to neutralize it will sweeten the sour bread too. Soak the bread crumbs, (a quart or less) for a few hours in as little sweet milk as will answer. Then mash them with a four tined fork, or otherwise reduce them to an even consistency. Add a teacupful of sour milk, a half teaspoonful of soda dissolved in tepid water, and flour enough to make a batter just right to bake the cakes light without being too thick and hard. Try a little on your hot buttered griddle if you are in doubt about it. Eggs are not necessary to make light good wholesome

pancakes of this kind, but when not too expensive, they add greatly to their delicacy and goodness.—Two, three, or four eggs, as you can spare them.

How the Mennonites Warm their Houses and Cook with Straw as Fuel.

The European Mennonites, whose religion prohibits bearing arms, have within a few years come to this country in large numbers, and have formed already prosperous colonies in Kansas and other Western States. In their new homes they follow their former pursuit—farming, and many of them brought with them the implements they formerly used, affairs so quaint and cumbersome, that they appear more like a collection of antiquities than articles for real use. Besides their farm implements, they brought over their household effects, conspicuous among which are a large clock to hang upon the wall, and a huge, curiously ornamented chest to hold the household treasures; these are to be seen in almost every Mennonite home. Though they could not well bring their enormous stoves to their new homes, they have brought their domestic customs with them, and the house in Wisconsin and Kansas is heated, and their meals are cooked in the same manner that they were in the old home in Russia and Prussia. Mr. H. Worrall, of Shawnee Co., Kas., sends us several remarkably neat sketches of Mennonite interiors, made with special reference to their methods of warming and cooking by the use of such an unusual fuel as straw. A portion of his sketches have been engraved and are given here. He also furnishes the following description: “The Americans burn money, we burn straw,”

Fig. 3.—SECTION OF MENNONITE HOUSE.

A, Fire Place; B, C, Ovens; D, Door for Firing; E, E, Flues in Stove.

says the Mennonite settler; how they manage to keep warm in winter, and to cook the year round with no other fuel but loose straw, is a mystery to the average American. The Mennonite immigrant, when choosing a locality, is quite unconcerned at the total absence of timber, and will settle many miles from wood or coal, with indifference as to the fuel question, in localities where an American would never think of making a farm. He sees fuel for the first year in the miles of grass about him, the second and succeeding years he will have the straw from his crops, and straw stacks are his favorite substitute for the wood-pile and the coal-bin.

“We first saw straw in use for fuel at the house of a Russian Mennonite bishop in the colony in McPherson Co., Kansas. Dinner for four of us was to be prepared. A vigorous young Mennonite girl vanished with a bushel basket, and returned with it full of loose straw, then placing her kettles, etc., on the top of the cook range, fig. 1, opened the fire-door, and thrust in two large handfuls of straw, touched the match, closed the door, and the kettle commenced singing almost immediately; in about two minutes the door was again opened, and two more handfuls of straw were thrust in and the door closed. Our dinner consisted of ham, eggs, potatoes, Russian waffles, and excellent coffee, all cooked in less time than an ordinary stove could have been made ‘hot for biscuits.’ The fire was ‘dead out’ before the dinner was half consumed.

and the house none the warmer for the fire, the surplus heat all escaping through the broad chimney.

"The cooking place and doors of the straw stove that heats the building, are all in the base of the chimney, which is eight feet square, with a stone floor; the walls are vertical for about 8 feet, when they are gradually brought in, reducing the interior of the chimney to about 12 inches at the comb of the roof. Figure 3 is a lengthwise section of a house of this kind. The upper portion of the chimney is the family smoke-house, in which are stored hams, shoulders, sides, and festoons of sausages hung on poles, permanently set in the walls, access being had to them by a ladder. On one side of the base is a large cauldron, for wash days, set in a furnace of adobe or *sun-dried* bricks; on the other side the cooking-range, also of adobe, having a sheet-iron top, with holes cut for the pots and kettles; both ranges, that for washing, and the one for cooking, have a flue of adobe four feet high.

"The heating stove, seen in section in fig. 3, and in the ground-plan, fig. 2, is 9 feet long, 8 ft. 6 in. high, and nearly 3 ft. wide, and forms part of

have been superseded by various liquid cleansing compounds. The cheaper kinds are simply Fuller's Earth, but the best are made of Fuller's Earth, soap, and ox-gall, made into balls, and dried. The active ingredient is ox-gall, which is quite as well used alone. It is an excellent article for removing

Fig. 1.—DESIGN FOR TRIMMING A ROOM.

all grease-spots from silks, etc., as it will unite with the grease without injury to the fabric. It may be used fresh, as obtained from the butcher, or the "prepared gall" may be had at the drug stores.

POLISHING COLLARS AND BOSOMS.—"M. J.," Hot Springs, Ark. No "recipe for starch" will be of much use in polishing linen, without the right kind of an iron rightly applied. A small lump of sper-

macti or white wax, or a little gum arabic, added to the starch, is thought to help, but the polish mainly comes from the iron. What are known as polishing irons have rounded corners, and the surface has a high

polish; hard rubbing and repeated of the starched linen with these brings the smooth shining surface seen in new shirts. Irons of this description are kept at house-furnishing and hardware stores.

SALT RAISING.—This must be set very early in the morning, if it is wished to bake the same day; set a sponge as follows: one quart of warm water, or milk and water; one tea-spoon salt; one-half tea-spoon soda; flour to make a soft batter; let it raise four hours; then sift two quarts flour into a pan and pour the sponge into the center, add one quart warm milk, and mix in flour enough to stiffen. Let it raise one hour—mould into loaves. Let it raise once more and bake in a rather moderate oven.

WHITE SPONGE CAKE, by Mrs. "S. A. R."—The whites of 11 eggs beaten to a stiff froth, 1½ glass of white sugar, 1 glass of flour, 1 teaspoonful cream of tartar; flavor with lemon, to taste; bake in half

Fig. 3.—TO HANG ON THE WALL.

an hour; sift the flour two or three times, so as to have it light as possible. Do not grease the pans you bake in, but when the cake is well baked, turn the pan top down, supported by something, and the cake will drop out in a short time. We suppose from directing Cream of Tartar, the omission of soda was accidental; either half as much of this should be added or the Cream of Tartar omitted.

Christmas Decorations at Home.

The remarks last month on Christmas Decorations had special reference to beautifying churches, but much that is said there as to ways and means will apply equally well to home decorations. Whatever may be done with the church, where the work, however elaborate, will be seen for but a few hours, let the home by all means be made bright and cheerful in this holiday time. Whoever visits New York City within a week of Christmas should not fail to make a tour of the streets near Washington Market, and see the immense quantities of evergreens on sale. There are great piles stacked in the streets and on the walks, and the whole neighborhood has for the time an unwonted fragrance of the woods. The purchaser can find large and small trees, short and long wreaths, with ready-made rings, crosses, stars, and many other devices. The decoration of the house may be as simple or as elaborate as one chooses; some do nothing more than to place a green wreath at each window facing the street, while others make carefully wrought designs for the principal rooms. Slender wreaths may be used in a great variety of tasteful decoration; the best material for these is the *Lyceopodiums* or Club Mosses, especially the one known as "Ground Pine" or "Bouquet Green," as its rich dark color and finely divided branches especially adapt it to this use. Suggestions for making wreaths were given last month; they may be hung over pictures, festooned

Fig. 2.—TO DECORATE A CORNICE OR DOORWAY.

along the cornice, and be worked into numerous tasteful shapes. In towns and cities the room is usually lighted with gas, and the chandelier forms a central point for decoration which should be treated with special care. But every farm-house can have some cheerful natural ornament, even if it be but branches of evergreens.

LETTERS FOR MOTTOES

are cut out of stiff brown paper, and should be of that style of letter known to printers as gothic, the forms as seen in this specimen, are very **SIMPLE**, and may be cut out by those who have little skill in lettering; they appear distinct and bold when covered with green. Holly, the best material for covering letters, is very rare with us, except in a few localities; small twigs of Arbor Vitæ and Box may be used, as may the leaves of Laurel (Kalmia), Rhododendron, Inkberry, or whatever broad leaved evergreen the locality may afford. The green is to be sewed to the paper pattern with dark green or black thread, and the edges kept very even to preserve a well-defined outline. Sometimes it is desirable to use white letters on a back-ground of green or other dark color; these may be cut from stiff white paper or card-board. It is recommended to cover the letters with mullage of gum Arabic, and sprinkle them thickly with rice grains. This is said (we have not tried it) to give the letters a rich appearance. Miss Massard, who is the great authority on floral decoration in England, makes use of perforated zinc as the foundation for her

MORE ELABORATE DESIGNS,

figs. 1 and 2 being from her work on "Floral Decorations." Perforated zinc is sheet zinc filled with small holes, after the manner of perforated card-board, which allow the leaves to be sewed to it. The engravings represent designs to go around the upper part of a room, along the cornice, or over a large doorway. Another of Miss H.'s designs is given in figure 3; this is also made on a foundation of perforated zinc. Such figures as this may be hung against the bare wall between pictures, over the mantle-piece, or wherever there is suitable space.

PICTURE AND MIRROR FRAMES

may be ornamented by placing a wreath to cover the cord (it may be tied to it if necessary), and long enough to hang down the sides of the frame. A very pretty effect is produced by making a frame of light lath, and neatly covering it with evergreens, bound on as directed last month for wreaths. This should be of the proper size to slip upon the frame, and it may be held in place by a fine wire and small tacks, which may be driven into the back of the frame without injury. If preferred, a frame of green may be made, to be suspended in front of and quite hide the proper frame of the picture; fine wire will come in play here as in many other cases... Where living plants are at command, they may be introduced as a part of the decoration with good effect, and for this purpose it is not necessary that they should be in flower.

FRUITS, FLOWERS, ETC.

Bits of color may be introduced in contrast with the green, and for this purpose bright colored berries seem more appropriate to the season than flowers. Berries of

Fig. 4.—MENNONITE WOMAN COOKING AT A HEARTH.

the partitions of the three rooms heated by it. The ovens in this stove are formed at top and bottom of narrow plates of rough cast iron, set loosely in the stove walls, to admit of expansion and contraction, the doors are of sheet iron, and the walls two bricks thick. In ordinary winter weather, fire is made in the stove every morning, when two good armfuls of straw is consumed in from 20 to 30 minutes, this heats the stove sufficiently for the whole day; in very cold weather, the fire is made two or three times each day, burning an equal amount of straw at each firing. So soon as the fire is out, the flue connecting the stove with the chimney is carefully closed by a damper, in order to retain the heat. Bread is baked in the ovens, and also in the fire chamber of the heating stove, where it is placed, immediately after firing, on a wrought iron stool, which will keep it above the ashes of the straw.

"The most primitive cooking arrangement was seen in Harvey Co., it being a 'hearth,' like that in figure 4. This is merely a block of adobe or masonry, two feet high, built in the base of the ordinary style of chimney. The cooking is done on this by building a fire with straw and corn-cobs under each cooking vessel, much the same as with persons camping out. The material used in the construction of these straw-burning stoves is brick, stone, and adobe; brick is preferred, next stone and adobe for economy in the first construction.

Household Notes and Queries.

"SCOURING-BALLS"—OX-GALL.—Mrs. "V. L. A.," Akron, O. These are very old affairs, much more used in England than with us, where they

the Black Alder, or Winterberry, which is own brother to the Holly, are very brilliant. Holly berries, the capsules of Climbing Bitter-sweet, or Wax-work, and other bright fruits, may be used. If flowers are employed, they will naturally be those of the everlastings, such as Helichrysms, and imported Immortelles. Scarlet and crimson colors are to be preferred; yellow, if used at all, should be introduced very sparingly, as it gives a garish effect, out of place at this season. Some choice design may occupy a conspicuous position on the mantel-piece, and for this, if there is a greenhouse, some nice bits of foliage may be spared, such as leaves of the Auenba (Gold-dust Plant), Lanrustinus, Bay Laurel, or whatever broad-leaved evergreen can part with a few leaves without detriment, not forgetting Ardisia, which has both leaves and berries. In such a design the leaves and berries of the Creeping Partridge-Berry (*Mitchella*) and Checkerberry, with bright colored lichens, may be worked in. A very pretty effect may be produced by "frosting" some parts of the decoration. What is sold at the paint and drug shops as "frosting," is glass in the thinnest possible scales; this is to be broken into small fragments and sprinkled upon leaves that have been touched with gum water; it glistens like frost.

BOYS & GIRLS' COLUMNS.

The Young Microscopist's Club.

It is rather too late in the year to talk about plants to most of you, but as I began to tell you a little about what are called the lower plants, and there is but one family left to be noticed, I will say something about that to complete the list. I have only tried to show you enough about these plants to allow you, especially with the help of your Microscope, to know a moss from a fern, a lichen from a moss, and so on. We now come to the *Algae*—the plural for *Alga*, the Latin word for seaweed. As we have no good common name for these plants, you must use the scientific one, and when you pronounce it, recollect that the *g* is hard in *Alga* and soft in *Algae* (as if written *Algha* and *Aljee*). "Sea-weeds" will hardly do as a common name for these plants, for while all true sea-weeds are *Algae*, all *Algae* are not sea-weeds, a great number belonging to fresh water. You will remember that I told you that all these plants, the club-mosses, the ferns, the mosses, the fungi, etc., were called *flowerless plants*, as they have no real flowers and seeds; the *Algae* are also *flowerless*. Among them we find the most minute and simplest of vegetable forms. As a general thing,

ALGAE ARE WATER PLANTS.

The few that do not live in the water are found in moist places. They inhabit both salt and fresh water, and like the other *flowerless plants*, have minute bodies called *spores* to answer for seeds. We find here a wonderful range in size, some being so small that you could hardly see them with your Microscope, up to some giant sea-weeds, the tallest—or longest—of all plants, over 700 feet in length. Being surrounded by water from which they absorb nourishment, they have no need of roots to

Fig. 2.

take up their food, and while some have what appears like a root, it is only to anchor them, while many float free in the water. I have already told you that all plants were made up of *cells*, and pointed out in a former talk how, by making a thin slice of corn-stalk, and of a young twig of maple, you could see these cells—sometimes globular or egg-shaped, sometimes longer and thread-like, but always, in every plant and every part of a plant, the Microscope shows nothing but cells of some kind, and their contents. Some of the *Algae* are so small that they

CONSIST OF A SINGLE CELL;

a mere bag without opening, and so minute that your Microscope would not just allow you to see it. I give some engravings to show how a plant of this kind looks with a very powerful glass. The green scum found in damp places is often an *Alga* of this kind. When largely magnified it is found to be made up of bodies like fig. 1. A tiny transparent bag, filled with greenish matter. A little thing—but to me one of the most wonderful things in the world! For here you have a *whole plant*, which can do all that any plant can—*e. i.* it can live, grow, and multiply. It has no root, stem, leaf, or flowers, and yet is as much of a plant (in one sense) as those having all these parts. When one of these plants gets its full size—*i. e.* we can conceive of so minute a thing having size—the green matter within slowly divides, as in fig. 2, and these halves divide again, as seen in fig. 3. A cover-

Fig. 3.

ing forms over each of these tiny green masses, and they really become young plants, just like the original, except in size. In time the wall of the mother cell breaks away and lets out these little ones; they soon grow to the full size, and go through with the same changes again; thus these minute plants increase very fast. It is only a small number of the *Algae* that are so small and simple as this. Many, like the Brook-silk, described in April last, consist of many long cells placed end to end, to form a thread (fig. 4). In others the cells are not only placed end to end, but side by side, to make a thin sheet or plate. Those who live near the seashore can find a great many forms of *Algae*, from the delicate kinds called "Sea Mosses," up to the coarse Rock-weed, and still larger Sea-weed called Kelp. That which is sold in the shops as

Fig. 4.—BROOK SILK.

"IRISH MOSS"

is a good example of one of the medium-sized sea-weeds, and by soaking up a bit of this you can see its real shape. The larger sea-weeds have fruit-dots, or places to hold their spores... You see what a wonderful variety plant life presents—from the minute *Alga* just described, up to the towering oak and pine; the *Alga* is but one simple rounded cell—the tree is only a mass of cells, some round, some long, and of different sizes, but all so minute as to require a microscope if we would see them... Among other queries, one boy wishes to know if our Microscope

WILL SHOW THE CRYSTALS IN SNOW.

I understand what he means; he has read of snow crystals and would like to see them. He can do so if he is patient and watches his chance, as all snow does not show them. The large flakes are confused masses, and do not show the crystalline form. It is only when the snow comes down so fine that it hardly makes any show in the air, but sifts down dry and almost dustlike, that you will find crystals. If you find snow on your coat sleeve as very minute dry spangles, you can see, without a glass, that it has a regular form, and if you use the glass you may see some of the forms shown in fig. 5, or others much like them, for there is a great variety among them. Sometimes the snow will be all mere six-sided plates, as shown at the left-hand in the middle row. I have seen them much like that at the right-hand of the middle row, and like the one under it with the spaces between the arms not so deep. The more beautiful crystals in the engraving are from drawings made in the Arctic regions. You must recollect that you can not take the snow crystals to your Microscope in a warm room and examine them at your leisure, but you must take your

Fig. 5.—SNOW CRYSTALS.

Microscope to your crystals. The glasses must be removed from the stand and used as a hand glass. Catch the snow on a piece of dark woollen cloth, and when you examine the crystals, try to keep your breath away from the glasses, else it will collect on them as frost and prevent you from seeing anything, and also melt the snow.

Our Puzzle-Box.

CROSS-WORD.

My first is in blossom but not in fruit,
My next is in wardrobe but not in suit,
My third is in ladder but not in food,
My fourth is in lovely but not in good,
My fifth is in liner but not in wait,
My sixth is in happy but not in great,
My seventh is in ocean but not in lake,
My eighth is in oven but not in cake,
My ninth is in barter but not in buy,
My tenth is in heaven but not in sky.
The letters, if placed aright, will show
One of our measures, which perhaps you know.

BIBLICAL DOUBLE ACROSTIC.

1. A son of Jacob and Rachel.
2. A battle-field of Joshua.
3. A district of Canaan.
4. A scriptural image of slavery.
5. Fifty-five.
6. A tree and its fruit.
7. A village of Palestine.

The initials and finals give the name of two celebrated ancient cities.

ISOLA.

NUMERICAL ENIGMAS.

1. I am composed of 19 letters:
My 5, 16, 17, is a tree.
My 2, 3, 15, 9, is an animal.
My 7, 8, 12, 16, we have been advised to let alone.
My 17, 5, 13, 1, 9, is a kind of fruit.
My 14, 1, 6, 19, 11, is an animal.
My 10, 11, 9, 4, 18, 6, is a city in Colorado.
My 18, 6, 3, 11, is a city in Pennsylvania.
My 14, 3, 9, 10, 15, 1, is one of a certain race of men.
My whole is an American poet. K. P. N.
2. I am composed of 13 letters:
My 1, 5, 12, 11, 13, is a species of heron, and a name for rice not divested of the husk.
My 8, 9, 7, 3, is a drink used by the peasants of Russia.
My 6, 10, 1, is a household article not as much used as formerly.
My 4, 2, 6, is a boy's nickname.
My whole is a bay on the coast of one of the United States. C. W. SHELMIER.
3. I am composed of 18 letters:
My 11, 13, 5, 17, 14, 15, is a fruit.
My 2, 18, 6, 3, 7, 14, 1, 8, may he seen on the face.
My 11, 10, 9, 2, 17, is a beverage.
My 4, 16, 12, 13, 15, is a fabric.
My whole is often consulted. L. N. J.

PUZZLE.

From what word can you take "six" and transpose the remaining letters into the fruit of an evergreen?

CHARADE.

When you come in from walking
My first doth meet your view;
Mind do not miss my second
Whatever else you do:
For, in this frosty weather,
With care my second take,
As, if you stumble on my whole,
You might produce an ache. Jos. H. BIRD.

ANSWER TO JOE LIVINGSTON'S PROBLEM.

1 woman at 50c.....	50
6 children at 25c.....	\$1.50
5 men at \$2.....	10.00
12 persons.....	\$12.00

SOLUTION TO THE PEDESTRIAN PROBLEM.

A takes 5 steps while B takes 4; A, therefore, takes $\frac{5}{4}$ as many as B. 3 of A's steps are equal to 2 of B's; A, therefore, steps $\frac{3}{2}$ as far as B. Multiply $\frac{5}{4} \times \frac{3}{2} = \frac{15}{8}$, which represents the value of A's effort as compared with B's, and makes it plain that A goes 10 miles while B goes 12 miles. Now by simple proportion, if A goes 10 miles while B goes 12 miles, then A will go 25 miles while B goes 30 miles. At 30 miles from the start they are together, and while B was walking that 30 miles, A walked only 25; hence A must have been 5 miles on the road when B started.

Some Items About Sugar.

On an average, every man, woman, and child in the United States consumes each year about 30 pounds of cane sugar, and nearly 2 gallons of molasses, besides maple sugar, honey, and other sweets... 19 lbs. of pure cane sugar is actually made up of, and can be changed into 8 lbs. of charcoal and 11 lbs. of water! Pure white starch is made up of 8 lbs. of charcoal (carbon) and 10 lbs. of water. Any boy can demonstrate this roughly by putting a small quantity of sugar on a piece of thin iron over a hot lamp or coals, and hold over it a glass jar bottom up. The sugar will change to pure charcoal, while the water will rise up and condense on the inside of the jar, if it be kept cool, and he will get nothing from the sugar but coal and water. The chemist can easily take the 19 lbs.

of sugar and change it into 8 lbs. of charcoal and 11 lbs. of pure water, though he has not yet learned how to put the coal and the elements of the water together to produce the sugar. That requires the action of the living plant....Our sugar comes mainly from the sugar cane grown in the Southern States (most from Louisiana), and from the West India Islands. The canes are somewhat like corn-stalks, but larger, taller, with narrower leaves. The sap or juice of the cane is pressed out between iron rollers, then boiled down to syrup, which crystallizes into sugar grains in large vats....Most of the sugar used in Europe is from the juice of the sugar-beet. It is similar to our cane sugar....The raw sugar is refined chiefly in

simple bodies or elements. Oxygen is an element, so is Nitrogen—but you can not see these. Sulphur (or Brimstone) is an element, so is Quicksilver (or Mercury), so are Iron and Gold when pure. You all know how Sulphur looks. Well, chemists, let them try their best can not separate it into any other substances—it is sulphur and nothing else. When a substance is found that contains only one kind of matter, and that no skill of the chemist will separate into two kinds, that is called an element. Thus far there are about 63 elements. In the air Oxygen and Nitrogen are merely mixed, the Oxygen is just as much Oxygen, and the Nitrogen just as much Nitrogen as before. But these elements unite

to form compounds, and when they do this the compound is quite unlike either element in every respect. Sulphur and Quicksilver unite to form the beautiful red vermilion, quite unlike either. Iron unites with Oxygen, and we have Iron Rust—quite different from Iron—and finally Oxygen and Nitrogen, which, when mixed in the air, are breathed, can be made to unite and form a most powerful acid—Nitric Acid (Aqua-fortis)—and so changed are they, so different the compound from the elements of which it is made, that the vapor suffocates at once, and the acid dropped on the flesh at once kills and destroys it.

THIS BRIEF LESSON IN CHEMISTRY

will give Master "G." and the rest of you something to think of. Now for the rest of the question. We may say that the Oxygen in the air we breathe does cause the heat of the body. He then says "if Oxygen is so hot, why is it that a fish which lives in among so much Oxygen, is so cold?"—He does not say so, but having heard that water is a large part Oxygen, he wonders why it is so cold. He starts with a wrong idea. "If Oxygen is so hot"—but it isn't hot, and the rest of his question goes for nothing. Still it allows me to say one more important thing. When these elements unite to form compounds, heat is usually given out, especially when one element is a gas, like Oxygen. Oxygen by itself is neither hot nor cold,

BUT IT PRODUCES HEAT

when it unites with other elements: when it unites with sulphur, heat is given off, when it unites with coal (carbon) we have heat accompanying the change, when it unites with wood, (carbon and hydrogen) there is heat. All our artificial heat comes from the union of oxygen with the fuel....But to go from heat to cold. Here is "S. C." of New Jersey, who has been reading about glaciers—those great fields of ice found in the Alps and other high mountain ranges, where there is perpetual snow. They are often several miles long, a half a mile and more wide, and occupying a valley, appear like a river of ice and—what is very wonderful—like a river, glaciers flow downward.

What troubles young S. C., is this, if glaciers are solid ice, how can they move or flow like a stream, for a book he has read, states that "a hut which Agassiz built on a glacier, moved 486 feet in two years." The flow of the ice of glaciers has been carefully studied by several philosophers, and they differ as to the matter. The cause of the movement is pressure from above, but how solid ice can flow, and go down as it must, over steep places, and still remain solid has long been a puzzle. Discover-

ies about ice made not many years ago, help explain the glacier movement. It has been found that when ice is under great pressure, it melts, and when this pressure is removed it becomes solid again; also that when two

EXPERIMENT WITH ICE.

smooth surfaces of ice are brought together, they at once freeze together and become solid. This property of ice is called REGELATION.

The explanation given of this is hardly suited to youngsters, who must for the present accept the fact that it is so, and that it is so they can prove by a very pretty experiment. Support a block of ice by the ends, two chairs will do, as shown in the engraving; I had occasion to show it some time ago, and set the block upon the bars of a partly open clothes-horse. Pass a copper wire, the size of a knitting needle or finer, over the block, and suspend a weight to it; I used two big stone hammers as they were at hand, but a basket of stones or other weight will answer. The ice under the wire will melt, the wire sinks in, and as it does so, regelation takes place, the water above the wire will at once freeze, and in a few hours the wire will be half way through the ice, with the block just as solid as ever. I tried it on a warm Autumn day, with the thermometer about 70°—for no matter how familiar I may be with an experiment, when I tell you about it, I always try it to see what difficulties you are likely to meet with when you undertake it. Now to apply this to the glacier; it is supposed that where the pressure is greatest, the ice melts, and parts of the mass can thus move and adjust themselves, and as soon as the pressure is relieved the ice becomes solid again—that the flow is a succession of meltings and freezings.

Winter Ways and Sports.

If one would see how the people of the far north live, and how they amuse themselves, they should visit them in winter. Those who travel for amusement go north in

Fig. 1.—HUNTERS' CAMP.—A NOVICE TRYING SNOW-SHOES.

Northern cities, by dissolving it, straining it through cloth, and through burned bones, after which it is boiled down until thick enough to crystallize in grains.

The Doctor's Correspondence.

The letters accumulate, and I am surprised as I look back, to find how long it is since I answered any of them. Here is one from "R. J. P.," Mankato, Minn., enclosing a

LEAF WITH BLACK SPOTS,

and he wishes to know about them. I should have mentioned this when speaking about the "Cluster Cups" last month. Those, you recollect, are *Fungi*, small plants living on the substance of the leaf; this which our Minnesota friend sends is a fungus, but of another kind, and this is about all he can learn about it at present....Sometimes youngsters ask questions that are regular puzzles. To answer them one must go a long way back into first principles, and write a treatise on matters in general. One "G.," at Enreka, Mo., has given me several questions of this kind; of these I can try only one now. He asks:

"WHAT IS AIR COMPOSED OF?"

I think Oxygen, Hydrogen, and Nitrogen, but how much of each? Is it not the Oxygen in the air which we breathe that keeps up the heat of our bodies? Then if Oxygen is so hot, why is it that a fish which lives in among so much Oxygen, is so cold?"—This question, or rather series of questions, shows a desire to know about things, and that "G." thinks and reasons, but it also shows that he has either not had an opportunity of learning about the air, or that he has been imperfectly taught. Let us see if we can help him in this case. Firstly, as to

THE COMPOSITION OF AIR.

Air is essentially a mixture of Oxygen and Nitrogen, in the proportion of one measure of the first to four measures of the other. You will notice that I make two words prominent by putting them in *Italics*. Essentially, for there are other things found in the air: watery vapor or moisture, the amount varying with the temperature, and Carbonic Acid, about one measure in every 2,500 measures of air. A very small proportion you will think, but small as it is, it is very important; I can not tell you more about this now, except to say that it is very necessary to the growth of plants. Still smaller quantities—mere traces of other substances—are also found in the air, but we will not notice them. The other word that I marked is *mixture*. For I wish you to understand that air is

A MIXTURE AND NOT A COMPOUND.

Now how can I make "G." and the rest of you understand this? Let us see. Certain substances are called

Fig. 2.—WINTER SPORTS—THE HUNTER ON SNOW-SHOES.

summer, and to the far south in winter; this is a mistake, for they see neither part of the country at its best. In the far north, where winter is long and cold, the short summers are very hot, and those who go there in summer, find the people engaged in trying to keep cool, and fail to see their proper home-life and amusements. As

Fig. 3.—A TOBOGGANING PARTY.—A CANADIAN SCENE.

you boys and girls can not go north just now, we must bring some of their winter ways to you. Many of our youngsters live up in the country of long winters, and what we are to say will be an every day matter to them, and they may wonder how it can interest any one to learn about things that are so common to them. But such should recollect that these Boys and Girls' Columns are read by many a boy and girl that never made a snow ball, and never saw the water "go to sleep," as one little girl we heard of described the forming of ice. Our far northern friends this month expect—if they are not already in the midst of snows—not a few inches that will thaw into "splosh" the next sunshiny day, but snows that come to stay; not only are inches piled upon inches, but foot upon foot until the whole country is covered several feet thick with a covering that will stay until spring. At first soft and fleecy, it makes walking almost impossible; soon it settles somewhat, and a crust forms upon it, the crust in time gets so hard that one can walk upon it, but at first it breaks at every step, and the traveller finds it more difficult than before. But people must go from place to place, and as they can not get through the snow, they must get over it. So the Indians thought, long before the white man came, and they invented the Snow-shoe. The Indians have not invented many things, but here they were obliged to contrive something, and they hit upon the very thing, one so well suited to its use, that no white man has been able to improve upon it; in fact even to-day an Indian can build a better pair of shoes—so say those who use them—than the most skillful White. Had you never heard of a snow-shoe, and were

shown one, it would be a long while before you could guess what it was to be used for; as you can see by fig. 5, it looks very little like a shoe. The frame, light and strong, is of bent ash; the central part is a strong netting of raw hide of the horse or ox; the fine netting is of cotton twine now, but formerly the Indians used bark; there is a band for the toe, and a cord or thong to fasten it to the foot. It is about three feet long, and a foot or a foot and a half wide at the widest part. This is the form in general use by the lumbermen and others, but the Indians often make for their own use a little different style—with toes turned up as in fig. 4. So there are fashions, you see, even in snow-shoes. If you wished to stand on the soft snow, you would lay down a board to keep your feet from sinking in. That is the principle

goes under the strap, and the shoe made fast to the ankle. Being all ready, the novice has then to learn to walk; this is no easy matter at first, for the shoes interfere, and he is very apt to tread on his own toes, and

Fig. 4.—INDIAN SNOW-SHOE.

over he goes. Figure 1 (on p. 475) shows the camp of a hunting party; one of them in making his first trial has met with the usual fate, and he will find it no easy matter to get up without help. But we are told by a friend who has travelled hundreds of miles upon them in the Arctic regions, that one soon learns to adapt his gait to these strange shoes, and can walk with great ease and rapidity. The other picture, fig. 2, of a hunter, shows how the shoes are fastened, and how the foot plays on them. Deer and elk, with their small sharp hoofs, break through the crust at every step, and are readily overtaken by the hunter on snow-shoes. Snow-shoes are necessary for lumbermen, hunters, farmers, and others who have to go about on the snow, but at the same time they are made to afford amusement. The young men have

Fig. 5.—FORM OF SNOW-SHOE USED BY HUNTERS.

of the snow-shoe—to give a broad surface to the foot, indeed very rough shoes are made simply of a piece of board; but the shoe should be as light as possible, and it is found that the net-work answers the purpose of a solid board—affording a broad surface with great lightness. The foot is well protected by a piece of blanket folded over it, and a heavy stocking over this; the toe

snow-shoe races, and even jump with them on.... Here in fig. 3 we have another amusement that is much less like work than racing in snow-shoes. A strange kind of a sled you will think it—but it is not a sled—it is a Toboggan, and in the far north tobogganing is a favorite amusement with old as well as young. The toboggan—no doubt an Indian name—is a thin board, turned up in front; the engraving shows the position of the driver, with his steering iron, and that of his passenger. Given a long hill, smooth snow, a moonlight night, and a number of fur-clad boys and girls, and we can imagine that a tobogganing party must be a most lively scene. But the frolic has its lesson: however long and swift the ride—the toboggan must be drawn up hill again!

The Monitor Seed Drill.

This is the most complete and positive Seed Drill ever invented. It is radically different from and superior to all others. It is the **only** machine which measures and drops the seed with a positive motion, and exactly the same amount at each foot or yard. It has been tested by 5 years' use in Massachusetts, and was awarded the highest prize at the "Centennial." The "Monitor" has been thoroughly tested during the season of 1878, and heartily endorsed as a **First Class Machine** by Professor Geo. Thurber, of New Jersey, and by Jas. Vick, of Rochester, N. Y.

Agents Wanted.—For full descriptive circular and testimonials, address THE MERRIMAC MACHINE CO., Newburyport, Mass.

VICK'S FLORAL GUIDE

A beautiful work of 100 pages, One Colored Flower Plate, and 300 Illustrations, with Descriptions of the best Flowers and Vegetables, and how to grow them. All for a FIVE CENT STAMP. In English or German.

The Flower and Vegetable Garden, 175 Pages, Six Colored Plates, and many hundred Engravings. For 50 cents in paper covers; \$1.00 in elegant cloth. In German or English.

Vick's Seeds are the best in the world. Send FIVE CENT STAMP for a FLORAL GUIDE, containing List and Prices, and plenty of information. Address JAMES VICK, Rochester, N. Y.

My Annual Catalogue of Vegetable and Flower Seed for 1879 will be ready by January, and sent free to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed-house in America, a large portion of which were grown on my six seed farms. Printed Directions for cultivation on every parcel. All seed sold from my establishment warranted to be both fresh and true to name; so far that should it prove otherwise, I will refund the order gratis. As the original introducer of the Hubbard and Marblehead Squashes, the Marblehead Cabbages, and a score of other new vegetables, I invite the patronage of all who are anxious to have their seed fresh, true, and of the very best strain. **NEW VEGETABLES A SPECIALTY.**

W. JENNINGS DEMOREST, 17 East 14th St., N. Y.

THE ROBBINS Family Washer AND BLEACHER.

A CARD.

We, the undersigned, respectfully announce to our former Agents and patrons that we have SOLD OUT our business, and that hereafter it will be carried on by the **BISSELL MFG CO.,** at 42 Murray St., New York, to whom they must apply for a continuation of their agency.

We also take pleasure in recommending the **BISSELL MFG CO.** to the favorable notice of all our former patrons.

Respectfully,

THE GEO. D. BISSELL CO.

NAUGATUCK, Conn., Oct. 12, 1878.

SPECIAL NOTICE.

We respectfully inform the public that we have purchased the business of the **GEORGE D. BISSELL COMPANY,** and have transferred it from **Naugatuck, Conn.,** to this City.

We have also changed the name from "**The George D. Biswell Company**" to the **BISSELL MFG CO.,** with Office and Warerooms at 42 MURRAY ST., NEW YORK, where all orders will be received.

We also take great pleasure in announcing that we now have a new and greatly improved pattern, with perfectly fitting pipes, thereby invariably obtaining the full power of the Washer.

As the result of much experimenting, we have succeeded in discovering a combination of metals of which the washer is now made, and which adds greatly to its value, and prevents absolutely the sticking of all resins or other matter upon the Washer, heretofore so difficult to cleanse after using. The Washer now comes out of the boiler as clean as when put in.

Another important change is in the name—from that of "**The Little Washer**" to the **FAMILY WASHER AND BLEACHER,** which it absolutely is.

Respectfully,

BISSELL MFG CO.

THE WASHER

Is in use in thousands of families in the United States, South America, Canada, Europe, and Australia. A test of it will establish its merit in any household. It will accomplish what no other washer has ever done. It cleanses thoroughly and bleaches perfectly, without rubbing or injuring the most delicate fabrics, even to lace curtains.

A circular, containing a full description of the Washer, the principle upon which it works, &c., &c., also extracts from letters and letters in full from those who are now using it, showing conclusively that the Washer is all that is claimed for it, will be sent to any address.

We want an Agent in every town in the United States. RELIABLE ENIGMATIC MEN can make a business which will pay them well. In writing, please mention the **American Agriculturist.**

Address the

BISSELL MFG CO.,

42 Murray St., New York.

A GOOD OFFER.

AMERICAN AGRICULTURIST.

ORANGE JUDD COMPANY, Publishers, 243 Broadway, N. Y.
ANNUAL SUBSCRIPTION TERMS (always in advance):
 \$1.50 each for single copies: Four copies, \$1.25 each:
 These rates include Postage, in each case, which is pre-paid
 by the Publishers. The papers are addressed to each name.

Good Things Free For Our Friends!

For Men, for Women, for Children—of All Occupations!

Large Pay for Little Work.

 If the Reader only knew the good quality
 and real value of these Premium Articles, and
 how easy it is to show the American Agriculturist to
 some friends and neighbors, tell them its value,
 and ask them to try it a year, and thus gather a
 few subscribers, and himself receive the premiums,
 he would take hold of it at once.

 **There are from 25 to 500 families, or more,
 in the vicinity of each Post Office, every one of
 whom would be benefited by having this Journal
 for a year, at a cost, postage included, of 2 cents
 a week. From one to a dozen premium clubs,
 small or large, may be gathered in the vicinity of
 each Post Office, and as many premiums be obtained.
 YOU may get one or more of them.

A GENERAL PREMIUM.—A free copy to
 Sender of a Club of 20 Subscribers, at \$1 each, without
 other Premiums. Instead of extra copy, any one
 sending 20 or more subscribers at \$1.00 each may select
 any premium offered, upon our List, to the amount of 10
 cents for every subscriber sent by him or her. Thus, any
 one sending 30 subscribers at \$1 each, may select any
 \$3 premium, or any two of which the price amounts to
 \$3. And so of any other premium, or List above 20.

Explanatory Notes.

Read and Carefully Note the following Items: The Table on this page tells the
 name and cash price of each article, and (in last column
 but one), gives the number of names sent in at the regular
 price of \$1.50 a year that will secure any premium article.
 (The last column gives the number of names at the
 lowest club price for four names, that is \$1.25
 each. Some persons quickly raise large clubs by taking
 all the names at \$1.25 each, or less, and themselves
 pay the difference, and even thus get the premium
 articles very cheaply.)...**(a)** All subscribers sent by
 one person count, though from several different Post-
 offices. But...**(b)** Tell us with each name or list of
 names sent, that it is for a premium...**(c)** Send the
 names as fast as obtained, that the subscribers may begin
 to receive the paper at once. Any one can have any time
 desired, up to next June, to complete any list, but every
 premium desired will be sent as soon as earned and ordered...**(d)** Send the exact money with each list
 of names, so that there may be no confusion of money accounts...**(e)** Old and new subscribers all count in premium
 clubs, but a portion at least should be new names;
 it is partly to get these that we offer premiums to canvassers...**(f)** One or two Specimen Numbers, etc., will be
 supplied free, as needed by canvassers, (when 3 cents per
 copy is furnished to pay for mailing), but extra numbers
 are expensive, and should be used carefully and economically,
 and where they will tell. Other specimen numbers
 will be sent, post-paid, to canvassers only, for 10 cents
 each. The price to others is 15 cents...**(g)** Remit money
 in Checks on New York Banks or Bankers, payable to
 order of Orange Judd Company, or send Post-office Money
 Orders. If neither of these is obtainable, Register Money
 Letters, affixing stamps both for the postage and registry;
 put in the money and seal the letter in the presence of
 the Post-master, and take his receipt for it. Money sent
 in any of the above ways will be safe against loss.
Illustrated Premium List sent free to applicants.

Table of Premiums

For Subscribers to American Agriculturist.

For Volume 38—(1879).

Open to All—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required at \$1.50 or at \$1.25
1	Boy's Tool Chest, (E. I. Horsman).....	1 00	8
2	Boy's Tool Chest (do.).....	2 50	5
3	Boy's Tool Chest (do.).....	5 00	15
4	Patent Magic Pencil (Ludden & Dow).....	1 50	4
5	Ladies' Magic Charm Pencil (do.).....	2 50	9
6	Girls' Magic Charm Pencil (do.).....	2 75	8
7	Gold Pen, Telescopic Case (do.).....	2 50	9
8	Gold Pen and Pencil, (comb'd) (do.).....	5 50	17
9	Little Girl's Wash Set, (C. W. F. Dare).....	75	2
10	Parchesi, (E. G. Selchow & Co.).....	1 62	4
11	Go-Bang, (do.).....	1 20	3
12	Sliced Objects, (do.).....	65	2
13	Sliced Birds, (do.).....	65	2
14	Sliced Animals, (do.).....	65	2
15	Vignette Authors, (do.).....	60	2
16	Portable Writing Desk, (C. W. F. Dare).....	1 25	3
17	Chess Men, (E. G. Selchow & Co.).....	3 20	6
18	Walnut Work Box, (C. W. F. Dare).....	1 15	3
19	Boy's Wagon, (do.).....	4 50	8
20	Our Boys' Wagon, (do.).....	8 00	12
21	Improved Bracket Saw, (do.).....	1 15	3
22	Bracket Saw Drill, No. 1.....	1 15	3
23	Buck-Saw for Boys, (C. W. F. Dare).....	1 00	3
24	Eagle Soap Bubble Toys (E. W. Bliss).....	1 00	3
25	Chastelle (Warner & Co.).....	1 00	3
26	Companion Autograph Album.....	1 00	3
27	Embroidery Frame.....	1 00	3
28	Crandall's Inq. Building Blocks, No. 3.....	1 90	2
29	Crandall's "District School".....	1 20	3
30	Crandall's Happy Family (New).....	1 20	3
31	Crandall's Heavy Artillery.....	3 00	6
32	Crandall's Chinese Blocks.....	1 25	3
33	Companion Tool Chest, No. 1.....	1 50	4
34	Knives and Forks (Meriden Cutlery Co.).....	14 75	19
35	Knives and Forks (do.).....	18 50	24
36	Carver and Fork (do.).....	3 75	7
37	Pocket Knife (do.).....	1 50	4
38	Pocket Knife (do.).....	2 00	5
39	Pocket Knife (do.).....	2 75	4
40	Ladies' Pocket Knife (do.).....	2 00	4
41	Multum in Parvo Knife (do.).....	3 50	7
42	Wire Bed Mattress (H. Buckingham).....	12 00	17
43	Sewing Machine, (Singer Man'g Co.).....	30 00	37
44	Sewing Machine (Domestic S. M. Co.).....	15 00	52
45	Sewing Machine (Remington).....	50 00	60
46	Sewing Machine (Wheeler & Wilson).....	60 00	70
47	Aquaplan (W. & B. Douglas).....	9 00	13
48	Self-adjusting Gold-plate Watch Key (J. S. Birch & Co.).....	1 00	3
49	Pocket Tool Holder (Miller's Falls Co.).....	1 00	3
50	Houchin's Imp. Pat. Pocket Cook Stove.....	1 25	3
51	Payson's Indefinite Ink—Pen, etc.....	75	2
52	Tubular Foot Lathe, No. 1, (Useful Machinery Co.).....	450 00	26
53	Piano Splendid Tact (Steinway & Sons).....	600	48
54	"National" Organ (G. A. Prince & Co.).....	150 00	1200
55	Universal Clothes Wringer, (Metropolitan Wash. Machine Co.).....	7 50	12
56	Turn-table Apple Parer (Goodell Co.).....	1 00	3
57	Climax Apple Corer & Slicer (do.).....	1 00	3
58	Family Cherry Stoner (do.).....	1 00	3
59	Bay State Apple Parer & Slicer (do.).....	1 50	4
60	"A" Saratoga Potato Peeler & Slicer (do.).....	1 00	3
61	Voore's Floor Set (Moore Man'g Co.).....	1 00	3
62	W. S. Blunt's "Universal Force Pump".....	12 00	18
63	Tea Set (Middleton Plate Co.).....	70 00	70
64	Ice Pitcher (do. do. do.).....	3 00	18
65	Syrup Cup with plate (do.).....	6 25	10
66	Child's Cup (do.).....	3 50	7
67	Butter Cooler (do.).....	6 50	10
68	Pickle Jar and Fork (do.).....	5 00	8
69	Cake Basket (do.).....	7 50	12
70	Cake Basket (do.).....	10 00	13
71	Casters (do.).....	5 25	8
72	Casters (do.).....	7 50	12
73	Casters (do.).....	10 50	15
74	Twelve Teaspoons (Meriden Cutlery Co.).....	7 25	21
75	Twelve Tablespoons (do.).....	14 50	19
76	Twelve Table Forks (do.).....	14 50	19
77	Child's Knife and Spoon (do.).....	3 00	6
78	French Cook's Knife, Fork, & Steel (do.).....	8 75	12
79	Case of Scissors (U. S. Steel Shear Co.).....	4 00	7
80	Family Scales (Fairbanks & Co.).....	14 00	19
81	Men's Pure Gum Knee Boots, (Candee).....	4 35	8
82	Boy's Pure Gum Short Boots, (do.).....	3 00	6
83	Household Press, (W. A. Boardman).....	2 10	4
84	Matthews' Garden Seed Drill, (E. & S.).....	12 00	18
85	Cannon's Broadcast Seed-sower.....	6 00	9
86	Woodruff's Patent Portable Barometer, (Square Case).....	12 00	17
87	Woodruff's Patent Portable Barometer, (Turned Case).....	8 00	12
88	New Hybrid Spring Wheat, "Champion," 3 lbs., (B. K. Bliss & Sons).....	2 00	4
89	New Hybrid Spring Wheat, "Defiance," 3 lbs., (Bliss).....	2 00	4
90	Breech-loading Pocket Rifle (Savage).....	14 00	19
91	Double Barreled Breech-loading Gun, (E. Remington & Sons).....	45 00	52
92	Creamoon Long Range Rifle (do.).....	100 00	200
93	Creamoon Long Range Rifle (do.).....	80 00	88
94	Creamoon Long Range Rifle (do.).....	60 00	70
95	Shot Gun, breech-loader, (do.).....	18 00	23
96	Archery Goods, Lancelwood Bow and half dozen Arrows.....	1 50	4
97	Canvas Gun Cover, (Thomson & Sons).....	1 50	4
98	Hunting Shoes, (do.).....	7 00	10
99	Dog Collar, (do.).....	1 00	3
100	Worcester's Great Illustrated Dictionary.....	10 00	15
101	Any Back Vol. Agriculturist.....	2 30	5
102	Any Two Back Volumes do.....	4 60	8
103	Any Three do. do.....	6 90	10
104	Any Four do. do.....	9 20	12
105	Any Five do. do.....	11 50	14
106	Any Six do. do.....	13 80	16
107	Any Seven do. do.....	16 10	18
108	Any Eight do. do.....	18 40	20
109	Any Nine do. do.....	20 70	22
110	Any Ten do. do.....	23 00	24
111	Any Eleven do. do.....	25 30	26
112	Any Twelve do. do.....	27 60	28
113	Any Thirteen do. do.....	29 90	30
114	Any Fourteen do. do.....	32 20	32
115	Any Fifteen do. do.....	34 50	34
116	Any Sixteen do. do.....	36 80	36
117	Any Seventeen do. do.....	39 10	38
118	Any Eighteen do. do.....	41 40	40
119	Any Nineteen do. do.....	43 70	42
120	Any Twenty do. do.....	46 00	44

The Premiums Nos. 4 to 8, 10 to 15, 17, 21, 22, 24, 26 to 29, 32, 33, 37 to 41, 43 to 51, 58, 89, 99, 101 to 108, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from p. 456.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

Deformed Ducks.—"R. P. McL., Pictou, N. S. When a duck is deformed in the wings, there is no method of cure. To prevent this, and similar deformities, breed only from perfect birds.

Bee-Stings Curing and Cured.—A recent "Medical and Surgical Reporter" states that a woman in Prague, who suffered greatly from gout, was persuaded to try bee-stings as a remedy; three bees were allowed to sting her arm in several places, and a cure soon followed. Another contributor, an M. D., and bee-keeper, says that when Tincture of Arnica was applied to bee-stings, "the relief was immediate and complete."

An Imperfect Teat.—"J. F. G." When two teats are grown together, it is probable that one duct is common to the two, in which case an operation, to separate them, would be unsuccessful. By inserting a probe in each teat, if there is but one duct, the probes will come together. If there are two milk ducts, the teats may be cut asunder by a skilled veterinary surgeon.

Sowing Rye in Corn.—"R. G. H., Shusan, N. Y. We should not apprehend any detriment to the corn from sowing rye at the last hoeing. The rye would take hardly anything from the soil, and if the ground is rich enough the corn could stand it very well. As a general practice it is not to be approved, but for fall or early spring pasture, it is of great benefit at little cost.

Improved Plows.—"W. A. M., Centerville, Ala. The most effective plow is one that turns the soil in the best manner with the least draft. The steel and the "Adamant" plows are claimed to do this, and so far as we have tried them, they do it effectively. The harder and the smoother the surface of the mold-board, the less friction there is, and if the shape is right, the least draft.

Unhealthy Pear-Leaves.—"O. A., Grange Co., O. sends leaves badly affected by a fungus—one of the "cluster-cups"—which has appeared this year for the first time. Probably the same has existed before, but in such small numbers as not to be noticed, and the present season has been favorable to their development. All that can be done is to promote the general health of the trees.

Moss on Upland Pastures.—"S., Mason, N. H. Moss upon dry grass lands may be easily destroyed by harrowing it thoroughly, sowing some fresh seed upon the new surface with a mixture of 100 lbs. of Peruvian guano or superphosphate of lime, and 100 lbs. of gypsum, per acre. Wet lands need draining.

Large Cows.—"J., Hoquiam, W. T. It is difficult to raise rich butter cows of a large size. If it pays to breed large oxen for draft, it would be best to select good cows of large frame. Perhaps the Hereford cow, crossed with a Shorthorn bull of a milking family, would be the best combination to secure both butter and beef.

Why Wheat Lodges.—"C. D. B., Rockland Co., N. Y. The stalks that grow rank and thick are succulent and weak, and when the tops are loaded with water, after heavy rains, they are easily laid flat by the wind, if not by their own weight. They have no power to raise themselves, and the crop is "lodged." In this condition the grain does not mature. This happens in soils that are rich in organic matter, and are deficient in lime. A liberal dressing of lime will remedy the defect. In sandy soils, the application of a few bushels of salt per acre has the same effect as lime upon clay soils. Thin sowing, as for instance only one bushel per acre, tends to cause a stiff growth of stalk, and prevent lodging.

The Steel-Plate Engraving for PREMIUM CLUBS.

Owing to the necessarily large expense of furnishing the Steel-Plate, it was at first intended to limit its offer to subscribers paying the full price of \$1.50 a year, and a small addition, and where no other premiums were given. But we have finally decided to place all subscribers, as nearly as possible, upon equal footing, and we therefore make the following offers to all who are collecting lists of subscribers for Premiums:

Subscribers in Premium Clubs for 1879, according to the terms in the table on page 481, and in the General Illustrated Premium List, published in November, can each of them have the Steel-Plate Engraving, by adding only 20 cents for each name, to cover cost of packing, postage, etc., on the Engraving; Or only 13 cents each, when the Engravings are to be sent by Express, *unpaid*, in a single parcel, to one individual.

The Rapidly Increasing Circulation of the German Agriculturist affords us gratifying assurance, that its many improvements are being observed and appreciated. The splendid full-page engraving which now appears in every number, is richly worth the whole year's subscription price. Every German cultivator and laborer on the farm, or in the garden, should have the paper; while its varied household departments make the journal invaluable to every German home, either in the Old World or the New.

Attention Sportsmen, Farmers and others.—We invite all subscribers and others who may wish to make purchases of guns, revolvers, or any and everything in the sportsman's line to communicate with us. Our arrangements are now so complete for supplying such goods that we believe we are able to furnish them of a better quality and at cheaper rates than they can be procured generally through the country. Our elegantly illustrated Sportsman's Library Catalogue mailed on the receipt of two 3-cent P. O. stamps. Address, Sportsman's Department of the Orange Judd Company.

From Dark to Dawn, published by J. C. McCurdy & Co., Philadelphia. This is an elegantly bound, printed and illustrated work of 632 pages. The illustrations are full page steel engravings. The work is a second series of "Night Scenes in the Bible," by Rev. Daniel March. Written in an attractive style. This story of some of the notable incidents of sacred history will find a welcome in many homes. It has the endorsement of prominent divines for accuracy, purity of sentiment and high moral tone.

The Honey Locust.—"W. K. C.," Auckland, New Zealand. This makes a quick-growing and effective hedge, as it is very thorny. It is also called Three-thorned Acacia; botanically it is *Gleditsia triacanthos*. The seeds, if kept in the pods, germinate as readily as beans; but it is safer to seed before sowing those sold by seedsmen. Sow in rows wide enough apart to work among them, and keep free of weeds the first summer. In fall take up, assort in sizes, and heel-in until spring, then set at 18 to 24 inches apart, and treat the same as other deciduous hedges. White Thorn or Hawthorn is nearly abandoned for hedges in this country; the leaves appear late, drop early, become sun-burned, and are attractive to numerous insects. Honey Locust seeds will cost you about 50 cts. per lb., postage added.

Economical Good Cookery.—In the N. Y. Cooking School, Miss Juliet Corson teaches classes of various grades, from the children of the poor, to the daughters of the rich, and the lessons are varied to meet the needs of people in different circumstances. The aim in all, is to teach the pupils to cook well, and at the same time to cook economically. In her "Cooking School Text Book," Miss Corson gives the courses of instruction in her different classes. It is not to be inferred from the title, that it is a mere dry "Text Book"; the lessons are presented in the attractive form of bills of fare, arranged in a systematic manner. The articles required for each dish are first enumerated, the quantity of each article and its cost are stated. Then follow directions, giving the progressive steps in their proper order, very explicitly, but without needless repetition or cumbersome detail. As cooking schools are being established in various parts of the country, this has been prepared to meet the demand for a "Text Book," but it is not the less a most useful work for every household, and will commend itself to housekeepers generally by the excellence of the recipes and their economical character. A work like this, has a great advantage over the old style of "Cook Book,"

which is sometimes a jumble of tried and untried recipes from all sources, with the briefest possible directions, or a mere naming of the ingredients, and no directions other than "bake in a brisk oven," or something like it. Here, the recipes have been tried over and over again, and in teaching them to classes, all the difficulties that the unskilled are likely to meet with have been noted, and the directions framed to anticipate them. This work will be especially welcome to those who have assumed the cares of housekeeping, without having had previous experience—instances which occur more frequently than many suppose—as in the case of those whose lives before marriage have been devoted to teaching or other occupation. So far as any directions can supply the want of experience, those given here will do it. We may refer again to the plan of this work in our household columns. It concludes with a most useful appendix upon the principles of nutrition and the chemistry of food. Published by the Orange Judd Company; sent by mail for \$1.25.

Specifications for Building.—Many a house costs vastly more than its owner expected, on account of "extras," which mainly occur because the items were not "down in the bond"—the specifications being faulty. To meet the want of full specifications—to include everything that is at all likely to enter into the construction of a frame-house, Messrs. Palliser, Palliser & Co., architects, of Bridgeport, Ct., and authors of "American Cottage Homes," have prepared and published a set which they find useful in their own practice, and are used by other architects also. These are intended for frame-houses, costing from \$500 to \$15,000, and appear to cover every possible item of masons', carpenters', plumbers', painters' and other work, all so arranged as to be readily filled up to meet each particular case. The full set of "Specifications" with two "Forms of Contract" are sent from this office; price, post-paid, 75 cents.

Change of Firm and Location.—The headquarters of the Robbins Family Washer are no longer at Naugatuck, Connecticut. The washer is now made by a new firm, the Bissell Manufacturing Co.; their office being at No. 42 Murray St., New York City.

The Eclectic Manufacturing Co., occupy rooms in the American Agriculturist building, at 245 Broadway, New York. They take the name "Eclectic," because they elect to manufacture anything they choose. Among their specialties are the "Empress Train Supporter" (not a railway train, but a dress-train), which is highly endorsed by no less an authority than Madame Demorest, and a safety pocket for the watch or porte-monnaie, which seems to be a practicable and valuable affair.

Gummed Household Labels.—Here is a brand new wrinkle. Messrs. Cornell & Shelton, of Birmingham, Conn., publish a book of labels for about everything that needs to be labeled in the household. These are in neat, clear type, and, being gummed on the back, are ready for immediate use. We once dined where soft soap was served for gravy, the saleratus-box having been mistaken for the salt-box—neither receptacle being marked. Everything of this kind should be labeled, and these books will be found most handy for the purpose.

New School Books.—"First Lessons in Arithmetic," by Wm. J. Milne; Jones Brothers & Co., Phila. An excellent idea: the child is taught to observe and to reason by the natural process of induction. Pictures embellish the book, and are made to teach the science of numbers. This is a most rational method. The second in the series is "Milne's Practical Arithmetic," written on the same inductive plan, which leads the student gradually on from simple principles to abstract calculations. We have at hand, also, a new "History of the United States," from the same publishers. It embraces the features of the well-known "Lyman's Historical Chart," and is written in a pleasing style, intended to make the pupil "love the inspiring story." All of these books are well printed and attractive in appearance.

Wire for Fencing.—"H. P.," Sparta, Ala. Wire fences have been extensively and successfully used; the usual size of wire is No. 9; the number of wires is 3, 4, or 5, as the case may require. Barbed wire is more effective than the common sort, but costs twice as much. Springs have been found effective in taking up the slack or in relieving the tension in changes of temperature. To make a fence proof against hogs, the wire must be placed 6 to 10 inches apart. The wire will last many years.

"The Youth's Companion."—If success is evidence of merit, the juvenile weekly with the above title, published by Perry, Mason & Co., Boston, should be of the highest order of merit, as its success is something wonderful—and when we say that it is deserved, we can give no higher praise. Parents can not be too careful in the kind of reading matter they provide for their children. Some of the journals published expressly for

youth are of a pernicious character, and children had better not read at all than to pore over such trash. The "Youth's Companion" is always pure in its tone and elevating in its tendencies, and may be placed in the hands of children with safety.

Foot Power Saw.—"F. J. T.," Cannon Falls, Minn. A foot power saw may be used to cut cord wood, but a heavy fly wheel will be necessary to equalize the force. Such a saw will not cut so fast as a horse-power, but will be more effective than a buck-saw.

Poultry for Market.—It is of little use for persons at a distance to send poultry to the New York or any other market, unless it is prepared and put in the style that custom has established for the particular city. For the New York market, poultry must *never be drawn*, for most of the New England cities it is always drawn. Those who wish to learn how poultry must be prepared to bring the best price in the New York market, can obtain a circular giving full directions by sending to E. & O. Ward, No. 279 Washington St., N. Y. The Messrs. Ward are among our oldest commission houses, and their instructions for putting up poultry and all other produce, are the result of a long experience in the business.

Caponizing Poultry.—"A. B. T.," Lewis' Practical Poultry book gives directions for making capons. Price, from this office, by mail, post-paid, \$1.50.

Hay Tea for Pigs.—"B. G. L.," Cecil Co., Ind., writes that he has raised some thrifty young pigs upon hay tea in place of milk, which could not be spared for them. Boiled corn and house slops were given in addition.

Manure for Potatoes.—"G. S. E.," Mineola, L. I. We know of crops of 150 bushels of potatoes per acre, being produced on an application of 400 lbs. of the Stockbridge potato manure, and 300 and 400 bushels from larger amounts of the fertilizer. The parties dealing in the "Stockbridge Manures," are reliable. Some hold that better potatoes can be produced with such fertilizers than with barn-yard manure; but it depends quite as much on the soil and method of using, as on the manure; this is too much of a question for discussion here. Whether corn or potatoes would pay the best with good manure and cultivation, depends on seed, soil, and the farmer; then, other things being equal, there would probably be little difference in the ultimate results.

Medium-Sized Fowls.—As a rule, the medium-sized fowls of a breed are better than the very large ones, for laying or for table use. Quality and symmetry usually go together; that is, the bird possessing the shape and style of its breed in the highest degree, is the nearest perfect in other particulars, and is of medium size. In the Asiatic breeds of fowls, the specimen which stands a trifle above the average height, is, in the majority of cases, the best in color, symmetry, and utility.

Plowing under Clover for Wheat.—"S. N. S.," Leadmine, W. Va. The beneficial effect of plowing in clover for wheat, is due to the mass of readily decomposable vegetable matter, rich in nitrogen, and which in decaying has an important chemical effect in the soil. The soil is not re-seeded by plowing in the crop. The first growth is cut, and the second crop plowed in, or both crops harvested and the stubble turned under; then re-seeded in the usual manner. It is a paying practice.

Red Swine in the West.—"C. S.," Sullivan Co., Ill. There are many red swine, commonly called "Jersey Red," or "Duroc" in Kentucky. There have been several large sales the past year, which probably distributed them in Illinois, Indiana and other Western States.

Shrinking of the Shoulder Muscles.—"J. O. M.," Sank Center, Minn. When the shoulder muscles of a horse have shrunk greatly, the only relief is the use of a stimulating application, such as turpentine and alcohol, with one dram of tincture of Spanish-flies to the pint, or camphorated spirit; apply, either with brisk rubbing and kneading of the muscles, twice a day.

The "Ayrshire Record," Vol. II., published by the Ayrshire Breeder's Association, J. D. W. French, North Andover, Mass., Editor. This "Record" is distinct from the "N. A. Ayrshire Register," noticed in October, and differs from it in bearing the sanction of an association, while the other is a private enterprise. In this, there are two classes: animals tracing directly to importation, and those that can not be so traced, but which are thought to be pure blooded. The "N. A. A. R.," only admits to registry those animals tracing directly to importation. Of course, this complication causes some confusion to the uninitiated; but it seems only fair that valuable animals, supposed to be pure, should have such a place of registry as the "Ayrshire Record" provides, so long as proper care is exercised in the entries. The editor con-

gratulates the Association on its prosperity, and the increased interest in the breed. The price of this book is \$3.00, and may be obtained of the editor, or of J. F. Brown, Providence, R. I., or at this office.

Is Plowing Injurious?—"A. M.," Centerville, Ala. Plowing is the only practical mechanical means we now possess for preparing the soil for crops. As a rule, the more the soil is plowed and worked, the more fertile it becomes. There need be no fear that exposing the soil to the sun by frequent plowing will injure it. On the contrary, soil is injured by being baked in the sun, when it lies unplowed and unworked.

Spayed Heifers.—"H. W. T." Heifers are usually spayed after having their first calf. Heifer calves are more difficult to operate upon than young bulls. It is necessary that the ovaries of the young animal be fully developed before the operation is performed.

Presidential Pork.—The D. M. Magie Co., Oxford, Ohio, sends us the porcine pedigrees pertaining to a pair of Presidential Poland pigs—at least we suppose we may call them "Presidential," as they have been purchased by President Hayes, and sent to his farm at Fremont, Ohio. The sow is "Oxford Princess," which shows that the President of a republic does not despise royal pork. But any monarchical tendency on this side of the pair is offset by the male, who is no prince at all, but merely "Rumler Boy," which is not even aristocratic. We are glad to see that the President has an eye to the future; when he lays aside the cares of office, if the climate will not allow him to enjoy "his own vine and fig-tree," he can have his own swine and piggery, and eat sausage that has a pedigree. Now that the Poland Chinas have the endorsement of the President, they would be holding up their heads if their necks were not so short, but what is more to the purpose, the D. M. Magie Co. write, in the same letter which informs us of this shipment to Fremont, that they had just shipped Poland Chinas to six different States. Singularly enough they think that their advertisement in the *American Agriculturist* is not wholly unconnected with this result.

Locality for Sheep Husbandry.—"M. S. G." Boston. There is perhaps no other locality better adapted for wool growing than that including South Western Texas, Western Kansas, and Southern Colorado; for the reasons that the climate is dry and healthful, pasture is cheap, and there will be but little expense for feed in the winter. The best sheep is the native ewes crossed with pure Merino, or other pure blood rams.

Disease of the Stifle.—"T. G." Gilman, Ill. The diseased condition known under the common name of "stified," in a horse, is a weakness of the ligaments of the patella or knee-cap. The bone then slips out of place, and the horse is helpless. If it occurs once, it is almost certain to repeat itself when the animal slips or suddenly jerks the limb. If the bone is dislocated, it must be returned by drawing the leg backwards, and operating on the joint in a manner which can not be intelligently described. The services of a competent person should be secured for the service. If the ligament is only weak, or is strained, the joint should be bathed with cold water in which a little saltpetre has been dissolved, to remove heat. After this has been sufficiently done, a strong decoction of white oak bark should be applied to the part. Light exercise should be given, lest the muscles become shrunken for the want of use.

"The Dog—Its Management and Diseases." By John Woodroffe Hill. This is the reprint of an English work, on a subject that receives much more attention in England than with us. We had already examined the English work before the reprint came to our notice, and found it a very plain and sensible treatise. The diseases to which the dog is liable, are plainly described in popular language, and the treatment, which depends much more upon general care than much medicine, is clearly indicated.—Sent from this office.—English edition for \$6.00. American Reprint for \$2.00.

60 lbs. Carried 1,000 Miles for 6 Cents! Any farmer who has raised wheat knows how heavy a bushel of wheat feels, after he has carried it half a mile or so. We have found it a full day's work with a good span of horses, to take 30 to 40 bushels 14 miles to market, and return with an empty wagon. How would it be if we had no railroads or canals, to transport to the seaboard shipping markets the immense grain products of the West and Northwest? During July of this year, the average rate paid for carrying wheat all the way from Chicago to New York, by the Lakes (1.7c.) and canal (4.3c.) was only **six cents** per bushel of 60 lbs., and for a bushel of corn, 56 lbs., 54 cents! The distance by this route is some 1,500 miles. The Railroads, to compete with the water routes, have had to carry grain at about the same rates, and the shortest distance by railroad is

nearly 1,000 miles. Allowing a team and driver only \$4 a day for wages, feed, and other travelling expenses, carrying 40 bushels, and going 33½ miles each day, the expense would be \$3 per bushel, providing that the team got loading enough homeward, to pay expenses and wages back. So, at the best, it would cost *fifty times* as much to carry grain to market by wagon, as it does by railroad. The same reckoning applies, in a lesser degree, to shorter distances. Shall we tear up the railway tracks, or abuse the owners, who do not receive 4 per cent, on the average, for the money invested? Ought we not rather to have a good deal of sympathy with the original builders of these roads, a large number of whom never got anything for the money expended—neither principal nor interest?—Not a very profitable business certainly.

Concrete Houses.—"J. R. D.," Ellsworth Co., Kas. Descriptions and plans of concrete houses were given in the *American Agriculturist* for December, 1874. The methods there described may be changed or modified to meet the demands of any special case.

The Use of the Ecraseur.—"E. B.," Jerseyville, Ill. The ecraseur is a very simple instrument. It consists of a chain loop, which is passed around the organ to be removed, and is then drawn up by a screw, so as to cut off the part by tearing. There is then little or no bleeding. It is simply a substitute for a knife in the operation of castration, and can be used in cases where the knife cannot. It was described in the *American Agriculturist* for Nov., 1874, which see for particulars.

The American Agriculturist Clubbed with Other Journals.

In response to numerous requests from our subscribers, relative to obtaining the *American Agriculturist* in connection with other publications, we have made arrangements with several of the leading Magazines, which will be forwarded in combination with our Journal as follows: [Postage additional when sent to foreign subscribers.]

	Regular price	The 2 sup- plied, post- paid, by both, us for
<i>American Agriculturist</i> with		
Scribner's Monthly (\$4.00).....	\$5.50.....	\$4.75
Scribner's St. Nicholas (\$3.00).....	4.50.....	3.90
Demorest's Monthly (\$3.00).....	4.50.....	3.90
Harper's Monthly (\$4.00).....	5.50.....	4.75
Harper's Weekly (\$4.00).....	5.50.....	4.75
Harper's Bazaar (\$4.00).....	5.50.....	4.75
Appleton's Journal (\$3.00).....	4.50.....	3.90
Popular Science Monthly (\$5.00).....	6.50.....	5.50
Atlantic Monthly (\$4.00).....	5.50.....	4.75

On receipt of subscriptions as above, we shall forward the names and money to the offices of publication of the magazines ordered, and should there ever be occasion for complaints of non-receipt of such magazines, these should be made direct to their respective Publishers, and not to us.

Catalogues Received.

NURSERYMEN.

GEO. ACHELIS, Westchester, Pa.—Trade list of a large stock of fruit and ornamental trees, etc.

AUGUSTINE & Co., Normal, Ill.—General wholesale list, including root-grafts and trees in bud.

G. H. BANTA, Riverdale, Bergen Co., N. J.—A large wholesale and retail list.

BELLEVUE NURSERY Co., Paterson, N. J.—Wholesale list of peralgoniums and other florists' stock.

CHAS. BLACK & BRO., Hightstown, N. J.—Makes a specialty of peach-trees, but has a full stock of others.

BUSH & SON & MEISSNER, Bushberg, Jefferson Co., Mo.—Send their full list of grape vines and small fruits. The immense list of grapes is classified in the same admirable manner that we have heretofore noted.

JOHN S. COLLINS, Moorestown, N. J.—One of the oldest small fruit nurseries, and has various novelties.

HARVEY CURTIS, Oswego, N. Y.—Marks down his stock at wholesale rates.

SAML. C. DeCOU, Moorestown, N. J., has a general variety of small fruits, with several specialties.

GIBSON & BENNETT, Woodbury, N. J., offers small fruits in general, including Felton's seedlings.

CHAS. A. GREEN, Clifton, Monroe Co., N. Y.—A list of small fruits, and a brief treatise on their culture.

A. HANCE & SON, Red Bank, N. J.—Send their wholesale and retail list for 1879, of a large and varied stock, with a number of specialties and novelties.

HEIKES' NURSERY Co., Dayton, Ohio—A wholesale list of fruit and ornamental trees.

D. E. HOXIE, Northampton, Mass., has a general list of small fruits.

JONES & SONS, Rochester, N. Y.—A wholesale list of fruit and ornamental stock.

McBROOM & WOODWARD, London, Canada.—Catalogue of bulbs and dried flowers, etc.

THOMAS MEEHAN, Germantown, Pa., sends a special list of ornamental trees, and small stock for mailing.

SAM'L. MILLER, Sedalia, Mo.—A variety of small fruits.

WILLIAM PARRY, Cinnaminson, Burlington Co., N. J.—New strawberries and raspberries, etc.

J. H. RICKETTS, Newburg, N. Y., offers two of his remarkable seedling grapes.

JOHN SAUL, Washington, D. C.—Sends his wholesale catalogue for '79, of fruit and ornamental trees.

SHINN & Co., Niles, Alameda Co., California.—A full list of fruit and ornamental trees, including many peculiarly adapted to the climate of the Pacific coast.

H. H. SMITH, West Haven, Conn., makes a specialty of the Crescent Strawberry, and has other proved sorts.

STORRS, HARRISON & Co., Painesville, Ohio.—Wholesale and retail lists for '79, of a large variety of fruit and ornamental trees, shrubs, etc.

JOHN VAN DOON, New Amsterdam, Wis.—Makes a specialty of small fruits at low prices.

LEO, WELTZ, Wilmington, Ohio.—General nursery stock, with a plate of the "Forest Rose" strawberry.

N. B. WHITE, Norwood, Mass.—New grapes and strawberries.

SEEDSMEN AND FLORISTS.

ROBERT BUIST, Philadelphia, Penn., sends a wholesale list of "well grown, clean, and properly named" greenhouse and stove plants.

HENRY A. DREER, Philadelphia, Penn., includes bulbs, seeds of the season, greenhouse and other plants, and horticultural appliances, all in one compact catalogue.

PETER HENDERSON & Co., No. 35 Cortlandt St., N. Y., have bulbs, seeds for fall sowing, plants for winter blooming, small fruits, and florists' requisites.

LEEDS & Co., Richmond, Ind.—A wholesale list of greenhouse plants, especially roses.

JOHN SAUL, Washington, D. C., sends a separate bulb catalogue—and very full it is.

STORRS, HARRISON & Co., Painesville, Ohio.—Special catalogue of bulbs and greenhouse stock.

FARM MACHINERY, IMPLEMENTS, ETC.

BLAXTER MANUFACTURING Co., Cincinnati, O., make everything in the way of sugar and sorghum machinery, steam engines, threshing machines; they publish a useful treatise on sorghum, its growth and manufacture.

BOOMER and BOSCHERT PRESS Co., Syracuse, N. Y. Their lard and tallow presses are the subject of a special catalogue. This press is made on the same principle as their well-known cider press.

BRADLEY & COMPANY, Syracuse, N. Y.—Circulars describing their reversible harrow, mowers, reapers, cultivators, hay rakes, and iron sleigh knees.

C. & G. COOPER & Co., Mt. Vernon, O.—A well illustrated catalogue of portable and traction farm, and stationary engines, mills, saws, etc. Also a farm engine circular.

P. K. DEDERICK, Albany, N. Y., give the history and specifications of the various patents of their remarkable presses for hay, cotton, etc., in a neat pamphlet.

A. HOAG, Grand Isle, Vt.—Illustrates and describes his planter for corn, beans, etc.

LIVINGSTON & Co., Pittsburgh, Pa.; "Monitor Corn Sheller," of which there are now over 20,000 in use.

N. P. MIX, Avenue, Franklin Co., O., claims that his is the "Banner Wind Mill."

SKINNER & WOOD, Erie, Pa., set forth the merits of their portable and stationary engines, boilers, etc., giving interesting information.

GARDNER B. WEEKS, Syracuse, N. Y.—Price list of cheese and butter factory and dairy supplies and apparatus. A handsome catalogue and a full list.

POULTRY.

A. C. NELLIS, Canajoharie, N. Y., offers Brown Leg-horns, and describes them in full.

EPH. R. NEWHARD, Meadow Lawn Poultry Yards, Allentown, Pa.—Light Brahmas, Plymouth Rocks, Hamburgs, Black African Bantams, turkeys, ducks, and geese. A small, but comprehensive circular.

W. G. TRACY, Towanda, Pa.—Has the leading breeds.

MISCELLANEOUS.

A. D. DYE & Co., Towanda, Penn.—Various cooking and heating stoves.

GREENFIELD TOOL Co., Greenfield, Mass.—A great variety of wares, from table cutlery to ox shoes.

JOSEPH HARRIS, Moreton Farm, Rochester, N. Y., tells about Cotswold-Merino crosses, in his catalogue of the above and pure-bred Cotswolds; also Essex pigs.

JOHNSON, BLACK & Co., Erie, Pa.—Describe their stoves furnished with the "Duplex Grate."

LAMB KNITTING MACHINE Co., Chicopee Falls, Mass.—Make, besides the well known Lamb Machine, the Tuttle Knitting Machine; each of which has its peculiarities.

MASSACHUSETTS ARMS Co., Chicopee Falls, Mass.—The Maynard Rifles with ammunition and appliances.

CLARK PETTIT, Salem, N. J., includes Jersey Red swine, with Southdown sheep, Plymouth Rock fowls, and Mammoth Bronze turkeys in a neat catalogue.

RANSOM STOVE WORKS, Albany, N. Y., and Chicago, Ill.—Offer their "New Helca" with the "Duplex Grate."

F. A. SINGLAIR, Mottville, Onondaga Co., N. Y.—Continue to make "Common Sense" chairs (of which we have already favorably spoken), in different styles.

UNION STOVE AND MANUFACTURING Co., Pittston, Pa.—Send a catalogue of their different heaters and ranges, that deserves special notice for the great excellence of its engravings and the taste that marks the whole.

WHITEHALL, TATUM & Co., 46 and 48 Barclay St., N. Y.—Jars for Museum specimens.

FOREIGN CATALOGUES.

WILLIAM BRICE & Co., Glasgow, Scotland.—Wholesale Price-current of farm and vegetable seeds.

NEW PLANT AND BULB Co., Colchester, Eng.—A full list of Japanese and other bulbs, orchids, etc.

P. SEBIRE, Ussy, France.—Sends his wholesale catalogue of general nursery stock.

WILSON & RANKIN, Glasgow, Scotland.—Wholesale list of garden and field seeds.

Imperial Egg Food.

H. H. STODDARD, Hartford, Conn.

Patent Concave Ox-Shoes.

The only forged ox-shoe made with concavity to fit hoof, and the best and cheapest.

GREENFIELD TOOL CO., Greenfield, Mass.

LOOK WELL TO YOUR

HORSE'S FEET.

This drawing shows how many horses are made lame and permanently injured by the use of the cold-cut and sheared pointed nails. This process of manufacture produces lamination, causing the iron to form in layers, and when driven into the foot the horny fibres of which the hoof is composed cause the nail to separate at the point, and one portion passes into the foot.

It requires but little observation and reflection, one would think, to arrive at the conclusion as to the kind of nails to be used, whether a mangled piece of iron, rendered dangerous by the Cold-Rolling and Shearing process, and liable to sliver in driving, thus,

or one made from the rod at a welding heat, where all the fibres remain intact, and a perfect oneness maintained, and which being pointed by the hammer renders such an accident as slivering utterly impossible.

"The Hot-forging process is the only sure manner of making a true driving and safe nail."

REV. W. H. H. MURRAY,
Golden Rule, October 31, 1877."

"After long usage, can safely recommend to all owners of track and light-harness horses your Hot-Forged Horse Shoe Nails. I consider all sheared nails unsafe for shoeing."

Respectfully yours, BUDD DOBLE."

The only Hot-Drawn and Hammer-Pointed Horse-Shoe Nail in the World

that is not cut, clipped, or sheared upon the point, and will not split in driving, is made by the

A BIG BARGAIN! A 1st CLASS SHOT GUN FOR \$5.50.

These Guns are single barrel muzzle loaders, brand new, 28 and 30 inch barrels, weight about 7 pounds, as good as in any \$10 Gun. WE WARRANT THIS GUN FOR FIVE YEARS. It balances perfectly, and we guarantee it to shoot as well as any \$25 Gun in the world. It is the best squirrel Gun that we ever sold at any price, and would be cheap at \$10; the lock alone is worth half what we ask for the Gun. *It is a first class made Gun in every respect, and will outshoot and outwear any Gun which is sold for \$10 by any firm in the U.S.* Bear in mind that this is a New American Made Gun, and it will last longer and give better satisfaction, both in manufacture and in price. We have secured them at a very low price, and offer them accordingly, *warranting them in every way.* Price, \$5.50 each; two for \$10. When cash in full comes with order, we will give free a steel wad cutter. We do these Guns up carefully on a board, and ship by express. *If parties desire them boxed, the extra charge will be 50 cts.* Bay State Arms Co., 93 Water St., Boston, Mass.

A \$10 SCROLL & JIG SAW FOR \$3.

BOYS here's a fortune for you.

"I made \$60 first month."

REDUCED PRICES.

Showing Saw and Lathe. It is less than a year since we offered our New Improved My Companion Jig Saw for sale. The overwhelming success we have met with has induced us to improve in manufacture and reduce in price. The My Companion Saw stands today is the finest piece of mechanism in the world for less than \$20, and it has that most important desideratum often missing in high priced machines and never before found in a low priced one, perfect steadiness and rigidity when in motion. It is a fact that our Saw will do as fine and perfect work as a \$100 steam power saw, and will saw with lightning speed through heavy inch thick board, thus doing what few \$20 machines will do, enabling the finest fretsawing and heavy fancy carpenter work to be done with the same machine. Over 1000 of our Saws are in use by carpenters and cabinet-makers in New England alone. TO THE BOYS of the U. S. we offer a prize never equalled. You can make \$5 a week working evenings alone, and learn a trade which if necessary will always give one good wages. Remember this is not a toy, it is a practical machine. It runs as easily and lightly as a sewing machine, and girls as well as boys can put the long winter evenings to good use, making useful articles and beautiful presents. A competent carpenter says, "I cannot make this saw for \$10; I should not get paid for my time alone." We make them by the 10,000; make each part with special and expensive machinery, which cuts out and finishes with great rapidity, each part fitting exactly where it belongs, and there is no waste of material or time. A SINGLE MACHINE COULD NOT BE MADE FOR \$15. The frames are of best oak and ash, with iron wheels, blocks, braces, and connections.

Showing Saw and Lathe.

VIEW OF LATHE AND SAW.

and steel bearings. Each one warranted for ten years; every one adjusted and tried before sold. Directions sent for putting together which can be done in ten minutes. (They are shipped packed in a neat crate only 36 inches by 13 inches by 4 inches, weighing about 25 lbs.) Every boy is delighted with bracket sawing; it pays them good wages, and their work commands a ready sale. Our saw completely fills the long felt want for a foot power saw that will do the best work, AND BE WITHIN THE REACH OF THE POOREST BOY. We make but very little on a single saw, but we mean that every boy in America shall have one. Both the press and mechanics flatteringly endorse our saw. IT IS AN UNPRECEDENTED BARGAIN. DESCRIPTION.—Length of Arms, 21 inches; Length of Arm for work, 18 inches; Height of table, 31 inches; Diameter of Balance Wheel, 61-2; Diameter of Drive Wheel, 12 inches; Length of Stroke, 13-4; Number of Strokes of Saw per minute, from 800 to 1,000; speed of Lathe, 8,000 revolutions per minute; length of wood that can be put in Lathe, 15 inches; diameter of wood that can be turned in Lathe, 31-2 inches. PRICES.—No. 1 Saw and powerful Drilling Attachment, with full set of Drills for boring in wood or iron, \$3. (No. 1 is represented by large cut above, and our price has always been \$3.50.) No. 2 Saw and Drill complete, (represented in small cut above) with powerful Circular or Buzz Saw, with bed and gauge, and a fine turning Lathe with full set of turning tools, \$5. This is a complete workshop with full sets of tools which could not be bought elsewhere equally as good for \$25. With each saw we give over fifty original Designs and Patterns, four Saw Blades, and four illustrated lessons for beginners. When the cash accompanies the order we give three extra saws, our 50 cts. prize sheet of Designs. If it is not all we claim in every particular, we will refund your money. Address all orders for the New Improved My Companion Scroll Saw to the Turner Manufacturing Co., 93 Water Street, Boston, Mass., U. S. A.

Easiest running, fastest cutting machine in the market. Cuts all kinds of Feed, Hay, Straw, and Corn Stalks. Superior to any in the market. Send for Circular, containing Description and Price List. C. PIERPONT & CO., Manufacturers, New Haven, Ct.

PATENTS

In connection with the publication of the *Scientific American*, we continue to act as Solicitors for Patents, Caveats, Trade-Marks, Copyrights, etc., for the United States, Canada, Cuba, England, France, Germany, etc. In this line of business we have had thirty-three years' experience.

Patents obtained through us are noticed in the *Scientific American*. This large and splendidly illustrated weekly paper shows the current progress of Science, is very interesting, and has an enormous circulation. Subscriptions \$3.50 a year, postpaid; single copies 10 cents. Sold at all Book-stores and News-offices.

Can I Obtain a Patent? The quickest and best way to obtain a satisfactory answer, without expense, is to write to us (Munn & Co.), describing the invention, with a small sketch. All we need is to get the idea. We will immediately answer, and give the necessary instructions. For this advice we make no charge.

We also send free our Hand Book about the Patent Laws, Patents, Caveats, Trade-Marks, their costs, and how procured, with hints for obtaining advances on inventions. Address MUNN & CO., Publishers of the *Scientific American*, 37 Park Row, New York.

ADAMS' PATENT SELF-FEEDING POWER CORN SHELLERS.

Strong, reliable, thorough in all parts of their work, (shelling, separating, cleaning, and elevating). Perfect self-feeders, and best machines for mill and warehouse purposes, as well as for farm and plantation. Their superiority attested by twenty years' use in the heavy corn-growing sections, during which time they have received first premium at all State and World's Fairs wherever exhibited.

197 Water St., N. Y.

The Chamberlin Screw Stump Machine,

after 10 years test, has proved its superiority over all others, by its great exhibition of strength and durability, combined with cheapness and ease in pulling all classes of stumps. The Company's challenge of \$1000 for a stump machine which would excel theirs, has stood since 1867 without being taken. They build 6 different sizes of machines, to pull all kinds of stumps. They make Subsoilers and Ditching Plows. For Particulars, Prices, etc., address THE CHAMBERLIN M'FG CO., Olean, N. Y.

Portable Mulay Saw Mill,

With improvements recently made is unequalled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of bands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubs, and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

BEATTY

\$1000 PIANO FOR \$255

BEATTY PIANO Superb Extra Grand Square Style No. 2023. Magnificent Rosewood Case, new and valuable improvements, elegantly finished. **Three Strings.** Weight, when boxed, over 1,000 lbs. Seven one-third (7 1-3) octave, full agraffe scale, rosewood case, all round corners, beautiful carved legs and lyre, heavy serpentine and top mouldings all around the case, back finished same as front. All improvements with Beatty's very latest full iron frames, bars and extra braces, improved new scale, overstrung bass. French grand action, fret desk, carved pedal, solid rosewood mouldings, ivory key fronts, capped hammers, agraffe treble and every improvement which can in any way tend to the perfection of the instrument has been added. This instrument is a magnificent Pianoforte. Regular Retail Price asked by the Monopolists about \$1000

I will sell this instrument direct during the HOLIDAYS, for only **\$255**

No such offers as these were ever made before, but knowing that their introduction will repay me on future sales, I offer them to readers of this paper at these prices during the holidays. Order direct from this advertisement, which will not appear again, and no further reductions can be made. Having met with unparalleled success within the past year and extended my sales over the world by an extended tour through the Continent of Europe, I have returned determined that no town or village in my native country shall be unrepresented by my instruments, and all energies, aided with ample capital, will be exerted to accomplish this object, hence the above offers, that can not be made by any other responsible house in America or the World. Don't miss these very valuable offers. Order now.

A fine two set of reed **\$600 Organ**, new and as good as the best of this capacity, for only **\$65**. Splendid \$30 to \$75 Organs, \$95, \$105 and \$150. Sub-Bass and Octave Coupler, \$35 to \$40; Organs, \$110 and \$120. Elegant pipe top Organs. More and better styles of case and sweeter toned instruments than can be bought of any other house. Pianos new and perfect, rosewood outside and in, usual price \$650, for only **\$150**. Grand, Square and Upright Pianos from \$175 to \$275, usually sold at from \$700 to \$1,000. All instruments shipped on 5 to 15 day's test trial. Money refunded and freight paid both ways if unsatisfactory to the buyer. Warranted six years. More unsolicited testimonials now on file than any manufacturer in the world. In ordering, state where you saw this advertisement. **Large Newspaper**, containing much information in regard to cost of Pianos and Organs, free. Beware of Irresponsible Imitators. If you do not want one yourself, order one and make your friend a handsome Christmas or New Year's Present. Address, **DANIEL F. BEATTY, Washington, New Jersey, U. S. A.**

\$375 Organ for \$97

NEW BOOKS

JUST PUBLISHED.

COOKING SCHOOL TEXT-BOOK

AND

HOUSEKEEPERS' GUIDE

To Cookery and Kitchen Management.

By Miss JULIET CORSON,

Superintendent of the New York Cooking School.

This work will be "a Household Treasure," explaining the system of Economical Cookery taught in the New York Cooking School. PRICE, POST-PAID, \$1.25.

New Edition—Revised and Enlarged.

Twenty-Five Cent Dinners

FOR FAMILIES OF SIX.

By Miss JULIET CORSON,

Superintendent of the New York Cooking School.

Miss Corson undertakes to show that a good dinner can be made for the sum of twenty-five cents, not only for one person, but for a family of six, comprising the two parents and four children of the usual ages and appetites. We can commend this work to every family, especially to farmers' families, who will find here the methods of cooking the articles of food furnished by the farm, in a variety of acceptable forms. Most farmers have a great abundance, but their tables lack variety, and to this end, Miss Corson's little book will be found full of useful hints.

PAPER COVERS, PRICE, POST-PAID, 25 CENTS.

New and Greatly Enlarged Edition of PRACTICAL FLORICULTURE.

A Guide to the Successful Cultivation of

FLORISTS' PLANTS,

For the Amateur and Professional Florist.

By PETER HENDERSON.

Author of "Gardening for Profit," and "Gardening for Pleasure."

ILLUSTRATED.

This valuable work, by Mr. Henderson, has become well known and deservedly popular everywhere. In it not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure, as well as those who make them a matter of trade. The work is characterized by the same radical common-sense that marked the author's "Gardening for Profit," and "Gardening for Pleasure," and it holds a high place in the estimation of lovers of floriculture. The important additions of new matter that have been made to the present edition, have been written mainly as general answers to hundreds of questions that have suggested themselves to those already in possession of the first and second editions of this work.

PRICE, POST-PAID, \$1.50.

New Edition—Revised and Enlarged.

THE SHEPHERD'S MANUAL.

A Practical Treatise on the Sheep.

Designed Especially for American Shepherds.

By HENRY STEWART.

ILLUSTRATED.

The first edition of this Manual has been so well received, and the letters acknowledging indebtedness for assistance derived from it have been so many and so emphatic, that the author has the best of reasons for presenting this new and enlarged edition to the public. It is intended to be so plain that a farmer, or a farmer's son, who has never kept a sheep, may learn from its pages how to manage a flock successfully, and to be so complete that even the experienced shepherd may gather some suggestions from it. The author feels, with enlarged experience since the first publication of the volume, that he can still more confidently than before encourage the young shepherd to accept this Manual as a guide and a counsellor. PRICE, POST-PAID, \$1.50.

Any one of the above named books sent post-paid on receipt of price.

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

Winter Greeneries at Home.

By REV. E. A. JOHNSON, D.D.,

Author of "Half-Hour Studies of Life," etc., etc.

NOTICES BY THE PRESS.

The many who have admired its plant embowered windows and vine-covered walls as they have passed the modest residence of the author of this little treatise, in Allegheny City, will at once concede his pre-eminent fitness to give instruction in the care of plants in the house. The contents of the volume were originally embodied in a series of letters to a number of his young friends, and they proved of so great service to them, that they urged their publication. The information is imparted in an engaging style, and is of a simple and practical sort.

The United Presbyterian (Pittsburg, Pa.)

It tells what plants to select, how to plant and take care of them, and how to arrange them in the most artistic ways for effect. The illustrations show how a few properly arranged plants, at a window, may be made to adorn a room, and give it a delightful summer aspect through the winter months.

New York Evening Express.

"Winter Greeneries at Home" is a very neat little work by Rev. Dr. Johnson, of Allegheny, Pa., devoted to Window Gardening, and largely the fruit of the author's successful experience in thus beautifying his own residence. The culture of flowers in an ordinary dwelling requires a loving care, and perhaps a native tact, not always purchasable with the best and most practical of books, but such volumes are calculated to develop these qualities where they have hitherto been latent, as well as to supply the place of much tedious experience, and obviate the dangers of many trying failures on the part of others. *Country Gentleman*, (Albany.)

In writing this volume, Dr. Johnson has told the secret of beautifying our homes in winter time. If one were to enter his study he would find there an illustration of success in this art. The knowledge is communicated in a fine and familiar way that brings teacher and pupil into sympathy with each other, and makes the study a delight.

Congregationalist and Boston Recorder.

It tells, in a pleasant and practical way, how to beautify the house with plants, vines, hanging baskets, and the many other decorations of vegetable life; how to produce luxuriant growth and bloom; how to grow plants from cuttings and seeds; how to train them to make a greenery successful, and, in short, all that any one needs to know about house plants.

Boston Globe.

The book itself is a little beauty, containing over one hundred pages of letter press, with quite a number of illustrative engravings, and can be had post-paid, from the publishers for one dollar, and for those who want to get all the practicalities of the subject in the shortest time and with the least labor, it will prove a treasure indeed.

St. Paul and Minneapolis Pioneer Press.

People who are desirous of beautifying their homes, will find the little book on Window Gardening, by E. A. Johnson, specially useful and suggestive. It tells what plants to select, how to plant and take care of them, and how to arrange them in the most artistic ways for effect. The illustrations show how a few properly arranged plants at a window may be made to adorn a room, giving it a delightful summer aspect through the winter months.

Commercial Advertiser (Buffalo, N. Y.)

The book is designed for the use of window gardeners who cannot afford expensive apparatus, and the hints and directions which it contains are of a sort to be followed out in almost any hour.

The Times (Philadelphia.)

In his aid toward beautifying our homes, and the light he throws upon the means of beautifying them with plants and flowers, Mr. Johnson is a public benefactor, and his efforts have been well seconded by his publishers, by whom the book has been beautifully made, with several enticing illustrations.

New York Evening Mail.

It is a complete manual of Window Gardening, containing full directions for the propagation and care of house plants, to those who desire the luxury of winter-blooming plants, this book will be of the first importance. *Indiana Farmer.*

"Winter Greeneries at Home," by Edwin A. Johnson, D.D., is a little book on Window Gardening, designed to meet the need of ordinary, unprofessional cultivators of flowers and plants for the house. It gives about all the information needed for successful Window Gardening.

New York Evening Post.

"Winter Greeneries at Home," by Edwin A. Johnson, D.D., is an admirable little work, containing practical instructions, with illustrations for the cultivation of plants in the house.

New York Daily Graphic.

It is treated in a plain easy-to-be-understood style, more like the familiar instructions of a practical florist given to his helper or assistant. If you would learn how to beautify your rooms, your windows, your lawns and gardens, with sweet flowers, and beautiful green drapery, get the book and study it.

Providence (R. I.) Press.

It contains, in a small compass, a great deal of information respecting the treatment of in-door plants during the winter months, based on the experience of years.

Evening Transcript (Boston.)

PRICE, POST-PAID, \$1.

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

House-Plans for Everybody.

By S. B. REED, ARCHITECT.

NOTICES BY THE PRESS.

The description of each design is singularly clear and concise, and contains many practical suggestions of no little value, while 175 illustrations, comprising elevations and ground plans of the cellar, and each floor of all the houses, render the little book complete. In fine, every one who wishes to build a home for his family, and has but a few hundred dollars to expend on it, should not fail to consult Mr. Reed's book, than which a more practically useful publication has not appeared in a long time. *New York Mail.*

It is one of the most practical treatises published, presenting plans and estimates for all classes of people. The volume is handsomely printed and bound, and is sold at the price of \$1.50.

Evening Post (Hartford.)

It is a book of over 240 pages, and contains plans, with full descriptions and estimates in detail of materials, labor and cost, of a great variety of buildings suited to the wants of farmers and others in moderate circumstances. To any man who contemplates building, this little book will be worth one hundred times its cost. *Practical Farmer* (Phila.)

Much information is given, which, before now, could only be obtained from very high-priced books. This volume should be in the hands of every man, who desires to possess his own home. It enables any one to form an estimate of the quantity and value of material needed in any alteration, or any new edition, or any fresh structure from a complete house at \$250 to the largest mansion.

The Publisher's Weekly (New York.)

It is complete in details, and its title indicates the character of the work. None should be without a copy, from the laborer to the capitalist who designs building. It is handsomely illustrated with designs, which give one an idea of the style and the cost of an inexpensive home to a mansion.

Staten Island Star (N. Y.)

Beginning with the simplest structure to cost in all \$250, it embraces a considerable variety of village and country dwellings, up to those involving an estimated expense of \$3,000, with many details which, although familiar enough to architects themselves, are often the ones most practically useful to builders and amateurs.

Country Gentleman (Albany.)

Forty different plans are given with their costs in detail. We have read the book with real interest, and then have returned to examine again some particular plans. There is pleasure and profit in its reading. It should be examined by every one proposing to build.

Providence Press (R. I.)

There are forty different designs, with 175 illustrations, and full descriptions and estimates in detail of labor, materials, and cost. The book contains many valuable hints for carpenters and builders, and, we believe, will be worth far more than its price to all contemplating the building of any residence within the range of prices here given.

Homestead (Springfield, Mass.)

The estimates are very intelligently made, and in the utmost detail, so that any builder or other person familiar with the cost of labor and material, can at once make due allowance for difference in prices in different localities. The book is one that can not fail to be of great use to any one proposing to build, as well as to the mechanic and contractor, who may glean a great deal of information from it.

Ducks Co. Gazette.

A good house should never be commenced until after mature, intelligent deliberation, assisted by all the information to be obtained. The want of a cheap, reliable work of reference, for popular use in village and country, has long been felt, but is now happily supplied in the work before us, bearing the title "House Plans for Everybody," and just published by the Orange Judd Co., New York. * * * * To any man who contemplates building, this little book will be worth a hundred times its cost.

The Ohio Farmer.

This is a very attractive volume, giving fifty different designs of village and country residences, costing from \$250 to \$8,000, including full descriptions and estimates in detail of materials and cost, labor, with many practical suggestions, and 175 illustrations.

Maine Farmer.

It is one of the most comprehensive and practical architectural treatises published, presenting plans and estimates for all classes of people. The volume is handsomely printed and bound, and is sold at the price of \$1.50.

Hartford (Ct.) Courant.

If additional proof were needed that our popular fashions of building have been crystallized into a recognized and characteristic style, based upon contemporary manners and customs, and upon our natural resources of material, this volume comes with a stamp of legitimacy upon it, which can not be denied. It distinctly sets forth the way in which we, in the Northern States, especially, plan and build the simpler sorts of country houses, farm houses, and what, for the want of a more convenient term, we call "suburban villas." There is nothing in it from beginning to end, indicating that the author has ever indulged himself either in the reproduction of foreign forms, or in the dangerous play of original invention. * * * * The costs range from \$250 to \$8,000, and those architects who desire to know by what mysterious processes, carpenters are able to produce houses far within what seem to be the lowest limits of expense, will find in this book much to enlighten them.

American Architect and Building News (Boston.)

PRICE, POST-PAID, \$1.50.

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

HOMES IN THE WEST.

To those who are looking in the West for new homes, the lands of the

Burlington and Missouri River Railroad in Nebraska

offer special and peculiar advantages. The lands lie in south-eastern Nebraska, adjoining the State of Iowa, and for soil, sub-soil, climate, water privileges, and for grain growing and stock raising facilities have no equals in the West.

The sales of land made by this Company during the year 1878 are equal to the combined sales of all the other land grants put together. A vast tide of people from the Middle and Eastern States has poured into this region during the last five years, and form a large and important element of the population.

The titles are perfect, and the land passes to the purchaser free from every encumbrance.

Full particulars are given on application to the

Land Commissioner of the B. & M. R. R., at Burlington, Iowa, or Lincoln, Nebraska.

RARE OPPORTUNITY.

Highly Improved Farm at a Sacrifice. 180 acres, cost, \$14,000 six years ago, will sell for \$9,500, on long time and low interest. For general farming best location in U. S. Write for particulars to

W. S. BLUNT'S UNIVERSAL FORCE PUMPS.

Secured by letters patent.

These pumps have enormous power, and are for the house or for out-door well, of any depth. They are constructed with special regard to strength, ease of working, and durability. They can be immediately changed from lift to force pumps, and the air chamber can be revolved, so as to allow the handle to work at any desired angle with the spout. Having close tops, they cannot be tampered with. Attention is called to our new elegant pattern **DEEP WELL non-freezing FIRE PUMP.** Also, Blunt's Sand Vacuum Chambers. A complete protection against sand or gritty water in dug or driven wells, pits, mines, and rivers. For hand or steam pumps, all sizes, from 1/4-inch to 4-inch suction pipe.

Send for circulars to **NASON MFG CO., 71 Eulton and 71 Beekman St., New York.** Western Agency, Chas. W. Newton, 150 Lake St., Chicago. Pacific Coast Agency, Dunham, Carrigan & Co., San Francisco, Cal.

An Important Book for Stock-Breeders.

STOCK-BREEDING :

A Practical Treatise on the Application of the Laws of Development and Heredity to the Improvement and Breeding of Domestic Animals.

By **MANLY MILES, M. D.**, late Professor of Agriculture in the Michigan State Agricultural College. 1 vol., 12mo. Cloth. With Illustrations. Price, \$1.50.

"It is somewhat remarkable, in this book-making age, that there is no systematic work accessible to the student in which the known facts and principles of the art of improving and breeding domestic animals are presented, in convenient form, for study and reference, notwithstanding the importance of live-stock to the farmer, and the wonderful progress that has been made in its improvement since the time of Bakewell. The present attempt to supply this want has been made in response to the repeated solicitations of persons interested in stock-breeding, who have attended my lectures on this subject, in various places, for several years past."—From Preface.

ALL AROUND THE HOUSE;

OR,

HOW TO MAKE HOMES HAPPY.

By **Mrs. HENRY WARD BEECHER**,
Author of "Motherly Talks," etc.

This volume, as its title implies, consists of papers upon topics concerning the ordering and the well-being of the household. It contains, in addition to a large number of recipes for cooking, and rules for marketing, numerous hints for the management of servants and children, directions as to furnishing, repainting, cleansing, etc., and information on all the innumerable things on which housekeepers need information, while, in addition to its usefulness as a guide to practical knowledge and economical methods, it is eminently interesting and suggestive, in its various essays on home topics, to every one concerned in the welfare and happiness of the household.

One vol., 12mo. Cloth. Price \$1.50.

For sale by all booksellers; or mailed, post-paid, to any address in the United States, on receipt of the price.

D. APPLETON & CO., PUBLISHERS,

549 & 551 Broadway, New York.

The LONG WINTER EVENINGS have Come.

AND NOW IS THE TIME TO SUBSCRIBE FOR THE

WEEKLY CRICKET ON THE HEARTH

The **Largest, Handsomest, Best, and Cheapest** Literary and Family Publication in the World. It is published **Every Week**, and is a mammoth 16-page, 64-column paper, (size of *Harpers Weekly*), every number **Elegantly Illustrated**, and filled with the **Choicest Reading Matter for Every Member of the Family.** It contains Serial Stories by Mrs. Ann S. Stephens, Wilkie Collins, Mrs. Henry Wood, Emerson Bennett, Margaret Blount, Esther Serle, Kenneth, Clara Augusta, and many other writers. Fascinating short Stories, Beautiful Poems, Complete Agricultural and News Departments, Household Receipts, Stories and Puzzles for the Young, Wit and Humor, Useful Knowledge, Fashion Notes, Answers to Correspondents, etc., etc. A **Complete Family Story, Agricultural, and Newspaper.** and the largest, best, and cheapest published anywhere. Terms, **Only \$2.00 per year**, or \$1.00 for six months. **The Weekly Cricket on the Hearth** is as **Large, and Equal in Every Respect, to any of the \$4.00 Weeklies**, and larger and better than any of the \$3.00 papers, and is the **Cheapest Paper of the Kind in the World.**

EXTRA GRAND OFFER! To any one who will send us **One Dollar** (and 10 cents extra for postage), we will send **The Weekly Cricket on the Hearth** for **Six Months** (26 issues), and also our charming new premium, "**An Album of Artistic Gems.**" containing six large and magnificent **Gems of Art**, (including American and Foreign Scenery, pleasing Home Subjects, etc.), the whole heartily bound in a handsome cover, and forming the most attractive ornament for the parlor or centre-table that could be devised. The engravings contained in this Album are perfect **Gems of Beauty**, and were designed and executed by the Aldine Company, publishers of the great Art Journal, *The Aldine*. Either the paper for Six Months, or the Premium, would alone be cheap at the price asked for both, and we guarantee everybody **Double Value of Money Sent.** Send it once and get the papers containing the opening chapters of **Three great Stories** just commenced, by three celebrated authors. Remember, we send 26 issues of **The Weekly Cricket on the Hearth**, and our magnificent Art Album, all for only **\$1.10. Write at once.**

ANOTHER GREAT OFFER! Upon receipt of **Only 15 Cents**, we will send the **Four Brilliantly Illustrated and Charming Holiday Issues of The Weekly Cricket on the Hearth** for the month of December. The small sum of 15 cents invested in this way will secure to you an amount of entertaining, amusing, and valuable reading for the **Long Winter Evenings** which could not be obtained in any other way for four times that amount. It will also enable you to read the three charming stories, just commenced by three celebrated authors. Don't fail to take advantage of one of the above great offers! **SPECIMEN COPIES.**—Our paper is too large, and the expense of publishing it too great, to allow us to send specimen copies free. We will send a specimen copy of the last splendidly illustrated issue upon receipt of **Five Cents.** The better way, however, is to take advantage of one of our grand special offers above. Address:

F. M. LUPTON & CO., Publishers, 245 Broadway, N. Y.

It will PAY YOU to READ This.

What 15 Cents will do! What \$1.10 will do!
